PLANE AND SPHERICAL

TRIGONOMETRY, SURVEYING

AND TABLES

 \mathbf{BY}

G. A. WENTWORTH, A.M.
AUTHOR OF A SERIES OF TEXT-BOOKS IN MATHEMATICS

REVISED EDITION

Boston, U.S.A., AND LONDON
GINN & COMPANY, PUBLISHERS
1895

Entered, according to Act of Congress, in the year 1882, by

G. A. WENTWORTH

in the Office of the Librarian of Congress, at Washington.

Copyright, 1895, by G. A. WENTWORTH.

PREFACE.

In preparing this work the aim has been to furnish just so much of Trigonometry as is actually taught in our best schools and colleges. Consequently, all investigations that are important only for the special student have been omitted, except the development of functions in series. The principles have been unfolded with the utmost brevity consistent with simplicity and clearness, and interesting problems have been selected with a view to awaken a real love for the study. Much time and labor have been spent in devising the simplest proofs for the propositions, and in exhibiting the best methods of arranging the logarithmic work.

The object of the work on Surveying is to present this subject in a clear and intelligible way, according to the best methods in actual use; and also to present it in so small a compass that students in general may find the time to acquire a competent knowledge of this very interesting and important study.

The author is under particular obligation for assistance to G. A. Hill, A.M., of Cambridge, Mass., to Prof. James L. Patterson, of Schenectady, N.Y., to Dr. F. N. Cole, of Ann Arbor, Mich., and to Prof. S. F. Norris, of Baltimore, Md.

G. A. WENTWORTH.

EXETER, N.H., July, 1895

CONTENTS.

PLANE TRIGONOMETRY.

CHAPTER I. Functions of Acute Angles:

Angular measure, page 1; trigonometric functions, 3; representation of functions by lines, 7; changes in the functions as the angle changes, 10; functions of complementary angles, 11; relations of the functions of an angle, 12; formulas for finding all the other functions of an angle, when one function of the angle is given, 15; functions of 45°, 30°, 60°, 17.

CHAPTER II. THE RIGHT TRIANGLE:

Given parts of a triangle, 19. Solutions without logarithms, 19; Case I., when an acute angle and the hypotenuse are given, 19; Case II., when an acute angle and the opposite leg are given, 20; Case III., when an acute angle and an adjacent leg are given, 20; Case IV., when the hypotenuse and a leg are given, 21; Case V., when the two legs are given, 21. General method of solving a right triangle, 22; solutions by logarithms, 24; area of the right triangle, 26; the isosceles triangle, 31; the regular polygon, 33.

CHAPTER III. GONIOMETRY:

Definition of goniometry, 36; angles of any magnitude, 36; general definitions of the functions of angles, 37; algebraic signs of the functions, 39; functions of a variable angle, 40; functions of angles greater than 360°, 42; formulas for acute angles extended to all angles, 43; reduction of the function of all angles to the functions of angles in the first quadrant, 46; functions of angles that differ by 90°, 48; functions of a negative angle, 49; functions of the sum of two angles, 51; functions of the difference of two angles, 53; functions of twice an angle, 55; functions of half an angle, 55; sums and differences of functions, 56.

CHAPTER IV. THE OBLIQUE TRIANGLE:

Law of sines, 60; law of cosines, 62; law of tangents, 64. Solutions: Case I., when one side and two angles are given, 64; Case II.,

when two sides and the angle opposite to one of them are given, 66; Case III., when two sides and the included angle are given, 71; Case IV., when the three sides are given, 74; area of a triangle, 78–79.

CHAPTER V. MISCELLANEOUS EXAMPLES:

Plane Trigonometry, 82–99; goniometry, 99–105. Examination Papers, 106–116.

CHAPTER VI. Construction of Tables:

Logarithms, 117; exponential and logarithmic series, 120; trigonometric functions of small angles, 125; Simpson's method of constructing a trigonometric table, 127; De Moivre's theorem, 128; expansion of $\sin x$, $\cos x$, and $\tan x$, in infinite series, 132.

SPHERICAL TRIGONOMETRY.

CHAPTER VII. THE RIGHT SPHERICAL TRIANGLE:

Introduction, 135; formulas relating to right spherical triangles, 137; Napier's rules, 141. Solutions: Case I., when the two legs are given, 142; Case II., when the hypotenuse and a leg are given, 142; Case III., when a leg and the opposite angle are given, 143; Case IV., when a leg and an adjacent angle are given, 143; Case V., when the hypotenuse and an oblique angle are given, 144; Case VI., when the two oblique angles are given, 144. The isosceles spherical triangle, 149.

CHAPTER VIII. THE OBLIQUE SPHERICAL TRIANGLE:

Fundamental formulas, 150; formulas for half angles and sides, 152; Gauss's equations and Napier's analogies, 154. Solutions: Case I., when two sides and the included angle are given, 156; Case II., when two angles and the included side are given, 158; Case III., when two sides and an angle opposite to one of them are given, 160; Case IV., when two angles and a side opposite to one of them are given, 162; Case V., when the three sides are given, 163; Case VI., when the three angles are given, 164. Area of a spherical triangle, 166.

CHAPTER IX. Applications of Spherical Trigonometry:

To reduce an angle measured in space to the horizon, 170; to find the distance between two places on the earth's surface, when the latitudes of the places and the difference in their longitudes are known, 171; the celestial sphere, 171; spherical co-ordinates, 174; the astronomical triangle, 176; astronomical problems, 177–185.

vii

SURVEYING.

CHAPTER I. DEFINITIONS. INSTRUMENTS AND THEIR USES:

Definitions, 135; instruments for measuring lines, 136; chaining, 136; obstacles to chaining, 138; the surveyor's compass, 141; uses of the compass, 143; verniers, 145; the surveyor's transit, 149; uses of the transit, 150; the theodolite, 150; the railroad compass, 150; plotting, 153.

CHAPTER II. LAND SURVEYING:

Determination of areas, 155; rectangular surveying, 159; field notes, computation, and plotting, 160; supplying omissions, 164; irregular boundaries, 164; obstructions, 164; modification of the rectangular method, 167; variation of the needle, 168; methods of establishing a true meridian, 170; dividing land, 173; United States public lands, 176; Burt's solar compass, 177; laying out the public lands, 179; Plane-table surveying, 181; the three-point problem, 186.

CHAPTER III. TRIANGULATION:

Introductory remarks, 187; the measurement of base lines, 188; the measurement of angles, 189.

CHAPTER IV. LEVELLING:

Definitions, 190; the Y level, 191; the levelling-rod, 191; difference of level, 192; levelling for section, 195; substitutes for the Y level, 198; topographical levelling, 200.

CHAPTER V. RAILROAD SURVEYING:

General remarks, 202; cross-section work, 202; railroad curves, \cdot 203.

PLANE TRIGONOMETRY.

CHAPTER I.

TRIGONOMETRIC FUNCTIONS OF ACUTE ANGLES.

§ 1. Angular Measure.

As lengths are measured in terms of various conventional units, as the foot, meter, etc., so different units for measuring angles are employed, or have been proposed.

In the common or sexagesimal system the circumference of a circle is divided into 360 equal parts. The angle at the centre subtended by each of these parts is taken as the unit angle and is called a degree. The degree is subdivided into 60 minutes, and the minute into 60 seconds. A right angle is equal to 90 degrees.

Note. The sexage simal system was invented by the early Babylonian astronomers in conformity with their year of $360~{\rm days}$.

In the *circular* system an arc of a circle is laid off equal in length to the radius. The angle at the centre subtended by this arc is taken as the unit angle and is called a *radian*.

The number of radians in 360° is equal to the number of times the length of the radius is contained in the circumference. It is proved in Geometry that this number is $2\pi (\pi = 3.1416)$ for all circles; therefore the radian is the same angle in all circles.

Since the circumference of a circle is 2π times the radius,

$$2\pi$$
 radians = 360°, and π radians = 180°;

Therefore,
$$1 \text{ radian} = \frac{180^{\circ}}{\pi} = \frac{180^{\circ}}{3.1416} = 57^{\circ} 17' 45''$$

and 1 degree =
$$\frac{\pi}{180}$$
 radian = 0.017453 radian.

By the last two equations the measure of an angle can be changed from radians to degrees or from degrees to radians.

Thus, 2 radians =
$$2 \times \frac{180^{\circ}}{\pi} = 2 \times (57^{\circ} 17' 45'') = 114^{\circ} 35' 30''$$
.

Note. The circular system came into use early in the last century. It is found more convenient in the higher mathematics, where the radians are simply expressed as numbers. Thus the angle π means π radians, and the angle 3 means 3 radians.

On the introduction of the metric system of weights and measures at the close of the last century, it was proposed to divide the right angle into 100 equal parts called *grades*, which were to be taken as units. The grade was subdivided into 100 minutes and the minute into 100 seconds. This French or centesimal system, however, never came into actual use.

EXERCISE I.

[Assume
$$\pi = 3.1416$$
.]

- 1. Reduce the following angles to circular measure, expressing the results as fractions of π . 60°, 45°, 150°, 195°, 11° 15′, 123° 45′, 37° 30′.
 - 2. How many degrees are there in $\frac{2}{3}\pi$ radians? $\frac{3}{4}\pi$ radians?

$$\frac{5}{8}\pi$$
 radians? $\frac{15}{16}\pi$ radians? $\frac{7}{15}\pi$ radians?

- 3. What decimal part of a radian is 1°? 1'?
- 4. How many seconds in a radian?

- 5. Express in radians one of the interior angles of a regular octagon; dodecagon.
- 6. On a circle of 50 ft. radius an arc of 10 ft. is laid off; how many degrees does the arc subtend at the centre?
- 7. The earth's equatorial radius is approximately 3963 miles. If two points on the equator are 1000 miles apart, what is their difference in longitude?
- 8. If the difference in longitude of two points on the equator is 1°, what is the distance between them in miles?
- 9. What is the radius of a circle, if an arc of 1 foot subtends an angle of 1° at the centre?
- 10. In how many hours is a point on the equator carried by the earth's rotation through a distance equal to the earth's radius?
- 11. The minute hand of a clock is $3\frac{1}{2}$ ft. long; how far does its extremity move in 25 minutes? [Take $\pi = \frac{2}{3}$.]
- 12. A wheel makes 15 revolutions a second; how long does it take to turn through 4 radians? [Take $\pi = \frac{2}{7}$.]

§ 2. THE TRIGONOMETRIC FUNCTIONS.

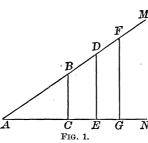

The sides and angles of a plane triangle are so related that any three given parts, provided at least one of them is a side, determine the shape and the size of the triangle.

Geometry shows how, from three such parts, to construct the triangle and find the values of the unknown parts.

Trigonometry shows how to *compute* the unknown parts of a triangle from the numerical values of the given parts.

Geometry shows in a general way that the sides and angles of a triangle are mutually dependent. Trigonometry begins by showing the exact nature of this dependence in the *right triangle*, and for this purpose employs the *ratios* of its sides.

Let MAN (Fig. 1) be an acute angle. If from any points

B, D, F, in one of its sides perpendiculars BC, DE, FG, are let fall to the other side, then the right triangles ABC, ADE, AFG, thus formed have the angle A common, and are therefore mutually equiangular and similar. Hence, the ratios of their corresponding sides, pair by

pair, are equal. That is,

$$\frac{AC}{AB} {=} \frac{AE}{AD} {=} \frac{AG}{AF}; \quad \frac{AC}{BC} {=} \frac{AE}{DE} {=} \frac{AG}{FG}; \text{ etc.}$$

These ratios, therefore, remain unchanged so long as the angle A remains unchanged.

Hence, for every value of an acute angle A there are certain numbers that express the values of the ratios of the sides in all right triangles that have this acute angle A.

There are altogether six different ratios:

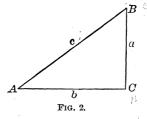

- I. The ratio of the opposite leg to the hypotenuse is called the Sine of A, and is written $\sin A$.
- II. The ratio of the adjacent leg to the hypotenuse is called the *Cosine* of A, and written $\cos A$.
- III. The ratio of the opposite leg to the adjacent leg is called the Tangent of A, and written tan A.
- IV. The ratio of the adjacent leg to the opposite leg is called the *Cotangent* of A, and written cot A.
- V. The ratio of the hypotenuse to the adjacent leg is called the *Secant* of A, and written sec A.
- VI. The ratio of the hypotenuse to the opposite leg is called the *Cosecant* of A, and written csc A.

These six ratios are called the **Trigonometric Functions** of the angle A.

To these six ratios are often added the two following functions, which also depend only on the angle A:

VII. The versed sine of A is $1 - \cos A$ and is written vers A. VIII. The coversed sine of A is $1 - \sin A$ and is written covers A.

In the right triangle ABC (Fig. 2) let a, b, c denote the lengths of the sides opposite to the acute angles A, B, and the right angle C, respectively, these lengths being all expressed in terms of a common A unit. Then,

$$\sin A = \frac{a}{c} = \frac{\text{opposite leg}}{\text{hypotenuse}}. \qquad \cos A = \frac{b}{c} = \frac{\text{adjacent leg}}{\text{hypotenuse}}.$$

$$\tan A = \frac{a}{b} = \frac{\text{opposite leg}}{\text{adjacent leg}}. \qquad \cot A = \frac{b}{a} = \frac{\text{adjacent leg}}{\text{opposite leg}}.$$

$$\sec A = \frac{c}{b} = \frac{\text{hypotenuse}}{\text{adjacent leg}}. \qquad \csc A = \frac{c}{a} = \frac{\text{hypotenuse}}{\text{opposite leg}}.$$

$$\text{vers } A = 1 - \frac{b}{c} = \frac{c - b}{c}. \qquad \text{covers } A = 1 - \frac{a}{c} = \frac{c - a}{c}.$$

EXERCISE II.

- 1. What are the functions of the other acute angle B of the triangle ABC (Fig. 2)?
 - 2. If $A + B = 90^{\circ}$, prove

$$\sin A = \cos B$$
, $\sec A = \sec B$,
 $\cos A = \sin B$, $\csc A = \sec B$,
 $\tan A = \cot B$, $\operatorname{vers} A = \operatorname{covers} B$,
 $\cot A = \tan B$, $\operatorname{covers} A = \operatorname{vers} B$.

3. Find the values of the functions of A, if a, b, c respectively have the following values:

(i.) 3, 4, 5. (iii.) 8, 15, 17. (v.) 3.9,

(ii.) 5, 12, 13. (iv.) 9, 40, 41. (vi.) 1.19, 1.20, 1.69.

4. What condition must be fulfilled by the lengths of the three lines a, b, c (Fig. 2) in order to make them the sides of a right triangle? Is this condition fulfilled in Example 3?

5. Find the values of the functions of A, if a, b, c respectively have the following values:

(i.) $2mn, m^2 - n^2, m^2 + n^2$. (iii.) pqr, qrs, rsp. (ii.) $\frac{2xy}{x-y}, x+y, \frac{x^2+y^2}{x-y}$. (iv.) $\frac{mn}{pq}, \frac{mv}{sq}, \frac{nr}{ps}$.

6. Prove that the values of a, b, c, in (i.) and (ii.), Example 5, satisfy the condition necessary to make them the sides of a right triangle.

7. What equations of condition must be satisfied by the values of a, b, c, in (iii.) and (iv.), Example 5, in order that the values may represent the sides of a right triangle?

Compute the functions of A and B when,

8. a=24, b=143. 11. $a=\sqrt{p^2+q^2}, b=\sqrt{2pq}.$ 9. a=0.264, c=0.265. 12. $a=\sqrt{p^2+pq}, c=p+q.$

13. $b = 2\sqrt{pq}, c = p + q$. 10. b = 9.5, c = 19.3.

Compute the functions of A when,

14. a = 2b. 16. $a+b=\frac{5}{4}c$.

17. $a-b=\frac{c}{4}$. 15. $a = \frac{2}{3}$ c.

18. Find a if $\sin A = \frac{3}{5}$ and c = 20.5.

19. Find b if $\cos A = 0.44$ and c = 3.5.

20. Find a if $\tan A = \frac{1}{3}$ and $b = 2\frac{5}{11}$.

- 21. Find b if cot A = 4 and a = 17.
- 22. Find c if sec A=2 and b=20.
- 23. Find c if esc A = 6.45 and a = 35.6.

Construct a right triangle: given,

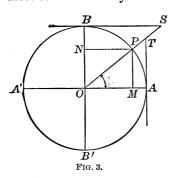

- 24. c=6, $\tan A = \frac{3}{2}$. 26. b=2, $\sin A = 0.6$.
- 25. a=3.5, $\cos A=\frac{1}{2}$. 27. b=4, $\csc A=4$.
- 28. In a right triangle, c=2.5 miles, $\sin A=0.6$, $\cos A=0.8$; compute the legs.
- 29. Construct (with a protractor) the \angle 20°, 40°, and 70°; determine their functions by measuring the necessary lines, and compare the values obtained in this way with the more correct values given in the following table:

	sin	cos	tan	cot	sec	csc
20°	0.342	0.940	0.364	2.747	1.064	2.924
40°	0.643	0.766	0.839	1.192	1.305	1.556
70°	0.940	0.342	2.747	0.364	2.924	1.064

- 30. Find, by means of the above table, the legs of a right triangle if $A = 20^{\circ}$, c = 1; also if $A = 20^{\circ}$, c = 4.
- 31. In a right triangle, given a=3 and c=5; find the hypotenuse of a similar triangle in which a=240,000 miles.
- 32. By dividing the length of a vertical rod by the length of its horizontal shadow, the tangent of the angle of elevation of the sun at the time of observation was found to be 0.82. How high is a tower, if the length of its horizontal shadow at the same time is 174.3 yards?

§ 3. Representation of the Functions by Lines.

The functions of an angle, being ratios, are numbers; but we may represent them by *lines* if we first choose a unit of length, and then construct right triangles, such that the denominators of the ratios shall be equal to this unit. The most convenient way to do this is as follows:

About a point O (Fig. 3) as a centre, with a radius equal to one unit of length, describe a circle and draw two diameters AA' and BB' perpendicular to each other.

The circle with radius equal to 1 is called a *unit* circle, AA' the *horizontal*, and BB' the *vertical* diameter.

Let AOP be an acute angle,

and let its value (in degrees, etc.) be denoted by x. We may regard the $\angle x$ as generated by a radius OP that revolves about O from the position OA to the position shown in the figure; viewed in this way, OP is called the *moving* radius.

Draw $PM \perp$ to OA, $PN \perp OB$. In the rt. $\triangle OPM$ the hypotenuse OP = 1; therefore, $\sin x = PM$; $\cos x = OM$.

Since PM is equal to ON, and ON is the projection of OP on BB', and since OM is the projection of OP on AA', therefore, in a unit circle,

 $\sin x =$ projection of moving radius on vertical diameter; $\cos x =$ projection of moving radius on horizontal diameter.

Through A and B draw tangents to the circle meeting OP, produced in T and S, respectively; then, in the rt. $\triangle OAT$, the leg OA = 1, and in the rt. $\triangle OBS$, the leg OB = 1; while the $\angle OSB = \angle x$. Therefore,

$$\tan x = AT;$$
 $\cot x = BS;$ $\operatorname{vers} x = AM;$
 $\sec x = OT;$ $\csc x = OS;$ $\operatorname{covers} x = BN.$

These eight *line* values (as they may be termed) of the functions are all expressed in terms of the radius of the circle as a unit; and it is clear that as the angle varies in value the

line values of the functions will always remain equal numerically to the ratio values. Hence, in studying the changes in the functions as the angle is supposed to vary, we may employ the simpler line values instead of the ratio values.

EXERCISE III.

1. Represent by lines the functions of a larger angle than that shown in Fig. 3.

If x is an acute angle, show that

- 2. $\sin x$ is less than $\tan x$.
- 3. $\sec x$ is greater than $\tan x$.
- 4. $\csc x$ is greater than $\cot x$.

Construct the angle x if,

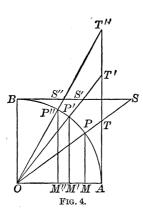

- 5. $\tan x = 3$.
- 7. $\cos x = \frac{1}{2}$.
- 9. $\sin x = 2\cos x$.
- 6. $\csc x = 2$. 8.
- 8. $\sin x = \cos x$.
- 10. $4\sin x = \tan x$.
- 11. Show that the sine of an angle is equal to one-half the chord of twice the angle.
- 12. Find x if $\sin x$ is equal to one-half the side of a regular inscribed decagon.
- 13. Given x and y, x + y being less than 90°; construct the value of $\sin(x + y) \sin x$.
- 14. Given x and y, x + y being less than 90°; construct the value of $\tan (x + y) \sin (x + y) + \tan x \sin x$.

Given an angle x; construct an angle y such that,

- 15. $\sin y = 2\sin x$.
- 17. $\tan y = 3 \tan x$.
- 16. $\cos y = \frac{1}{2}\cos x$.
- 18. $\sec y = \csc x$.
- 19. Show by construction that $2 \sin A > \sin 2 A$.
- 20. Given two angles A and B, A+B being less than 90°; show that $\sin(A+B) < (\sin A + \sin B)$.
- 21. Given $\sin x$ in a unit circle; find the length of a line corresponding in position to $\sin x$ in a circle whose radius is r.
- 22. In a right triangle, given the hypotenuse c, and also $\sin A = m$, $\cos A = n$; find the legs.

§ 4. Changes in the Functions as the Angle Changes.

If we suppose the $\angle AOP$, or x (Fig. 4) to increase gradually by the revolution of the moving radius OP about O,

the point P will move along the are AB towards B, T will move along the tangent AT away from A, S will move along the tangent BS towards B, and M will move along the radius OA towards O.

Hence, the lines PM, AT, OT will gradually increase in length, and the lines OM, BS, OS will gradually decrease. That is,

As an acute angle increases, its sine, tangent, and secant also increase, while its cosine, cotangent, and cosecant decrease.

On the other hand, if we suppose x to decrease gradually, the reverse changes in its functions will occur.

If we suppose x to decrease to 0°, OP will coincide with OA and be parallel to BS. Therefore, PM and AT will vanish, OM will become equal to OA, while BS and OS will each be infinitely long, and be represented in value by the symbol ∞ .

And if we suppose x to increase to 90°, OP will coincide with OB and be parallel to AT. Therefore, PM and OS will each be equal to OB, OM and BS will vanish, while AT and OT will each be infinite in length.

Hence, as the angle x increases from 0° to 90° ,

 $\sin x$ increases from 0 to 1, $\cos x$ decreases from 1 to 0, $\tan x$ increases from 0 to ∞ , $\cot x$ decreases from ∞ to 0, $\sec x$ increases from 1 to ∞ , $\csc x$ decreases from ∞ to 1. The values of the functions of 0° and of 90° are the *limiting* values of the functions of an acute angle. It is evident that (disregarding the limiting values),

Sines and cosines are always less than 1;

Secants and cosecants are always greater than 1;

Tangents and cotangents have all values between 0 and ∞ .

REMARK. We are now able to understand why the sine, cosine, etc., of an angle are called functions of the angle. By a function of any magnitude is meant another magnitude which remains the same so long as the first magnitude remains the same, but changes in value for every change in the value of the first magnitude. This, as we now see, is the relation in which the sine, cosine, etc., of an angle stand to the angle.

§ 5. Functions of Complementary Angles.

The general form of two complementary angles is A and $90^{\circ} - A$.

In the rt.
$$\triangle$$
 ABC (Fig. 5),
 $A + B = 90^{\circ}$; hence $B = 90^{\circ} - A$.
Therefore (§ 2),
 $\sin A = \cos B = \cos (90^{\circ} - A)$,
 $\cos A = \sin B = \sin (90^{\circ} - A)$,
 $\tan A = \cot B = \cot (90^{\circ} - A)$,
 $\cot A = \tan B = \tan (90^{\circ} - A)$,
 $\sec A = \csc B = \csc (90^{\circ} - A)$,
 $\csc A = \sec B = \sec (90^{\circ} - A)$,
Therefore,

Each function of an acute angle is equal to the co-named function of the complementary angle.

Note. Cosine, cotangent, and cosecant are sometimes called cofunctions; the words are simply abbreviated forms of complement's sine, complement's tangent, and complement's secant.

Hence, also,

Any function of an angle between 45° and 90° may be found by taking the co-named function of the complementary angle between 0° and 45° .

EXERCISE IV.

1. Express the following functions as functions of the complementary angle:

sin 30°. tan 89°. csc 18° 10′. cot 82° 19′. cos 45°. cot 15°. cos 37° 24′. csc 54° 46′.

2. Express the following functions as functions of an angle less than 45° :

sin 60°. tan 57°. csc 69° 2′. cot 89° 59′, cos 75°. cot 84°. csc 85° 39′. csc 45° 1′.

- 3. Given $\tan 30^{\circ} = \frac{1}{3}\sqrt{3}$; find $\cot 60^{\circ}$.
- 4. Given $\tan A = \cot A$; find A.
- 5. Given $\cos A = \sin 2 A$; find A.
- 6. Given $\sin A = \cos 2 A$; find A.
- 7. Given $\cos A = \sin (45^{\circ} \frac{1}{2} A)$; find A.
- 8. Given $\cot \frac{1}{2} A = \tan A$; find A.
- 9. Given $\tan (45^{\circ} + A) = \cot A$; find A.
- 10. Find A if $\sin A = \cos 4 A$.
- 11. Find A if $\cot A = \tan 8 A$.
- 12. Find A if $\cot A = \tan nA$.

§ 6. Relations of the Functions of an Angle.

Formula [1]. Since (Fig. 5) $a^2 + b^2 = c^2$, therefore,

$$\frac{a^2}{c^2} + \frac{b^2}{c^2} = 1$$
 or $\left(\frac{a}{c}\right)^2 + \left(\frac{b}{c}\right)^2 = 1$.

Therefore (§ 2), $(\sin A)^2 + (\cos A)^2 = 1$; or, as usually written for convenience,

$$\sin^2 \mathbf{A} + \cos^2 \mathbf{A} = 1.$$

That is: The sum of the squares of the sine and the cosine of an angle is equal to unity.

Formula [1] enables us to find the cosine of an angle when the sine is known, and *vice versa*. The values of $\sin A$ and of $\cos A$ deduced from [1] are:

$$\sin A = \sqrt{1 - \cos^2 A}$$
, $\cos A = \sqrt{1 - \sin^2 A}$.

Formula [2]. Since

therefore (§ 2),

$$\frac{a}{c} \div \frac{b}{c} = \frac{a}{c} \times \frac{c}{b} = \frac{a}{b'}$$

$$\tan \mathbf{A} = \frac{\sin \mathbf{A}}{\cos \mathbf{A}}.$$
 [2]

That is: The tangent of an angle is equal to the sine divided by the cosine.

Formula [2] enables us to find the tangent of an angle when the sine and the cosine are known.

Formula [3]. Since

$$\frac{a}{c} \times \frac{c}{a} = 1, \quad \frac{b}{c} \times \frac{c}{b} = 1, \quad \text{and} \quad \frac{a}{b} \times \frac{b}{a} = 1,$$
therefore (§ 2),
$$\begin{cases} \sin \mathbf{A} \times \csc \mathbf{A} = 1 \\ \cos \mathbf{A} \times \sec \mathbf{A} = 1 \\ \tan \mathbf{A} \times \cot \mathbf{A} = 1 \end{cases}$$
[3]

That is: The sine and the cosecant of an angle, the cosine and secant, and the tangent and cotangent, pair by pair, are reciprocals.

The equations in [3] enable us to find an unknown function contained in any pair of these reciprocals when the other function in this pair is known.

EXERCISE V.

1. Prove Formulas [1]-[3], using for the functions the line values in the unit circle given in § 3.

Prove that

2. $1 + \tan^2 \mathbf{A} = \sec^2 \mathbf{A}$.

 $3. \quad 1 + \cot^2 \mathbf{A} = \csc^2 \mathbf{A}.$

Note. — Equations 2 and 3 should be remembered.

4.
$$\cot A = \frac{\cos A}{\sin A}$$

5. $\sin A \sec A = \tan A$.

6. $\sin A \cot A = \cos A$.

7. $\cos A \csc A = \cot A$.

8. $\tan A \cos A = \sin A$.

9. $\sin A \sec A \cot A = 1$.

10. $\cos A \csc A \tan A = 1$.

11. $(1-\sin^2 A) \tan^2 A = \sin^2 A$.

12. $\sqrt{1-\cos^2 A} \cot A = \cos A$.

13. $(1 + \tan^2 A) \sin^2 A = \tan^2 A$.

14. $\csc^2 A (1 - \sin^2 A) = \cot^2 A$.

15. $\tan^2 A \cos^2 A + \cos^2 A = 1$.

16. $(\sin^2 A - \cos^2 A)^2 = 1 - 4 \sin^2 A \cos^2 A$.

17. $(1 - \tan^2 A)^2 = \sec^4 A - 4 \tan^2 A$.

18.
$$\frac{\sin A}{\cos A} + \frac{\cos A}{\sin A} = \sec A \csc A.$$

19. $\sin^4 A - \cos^4 A = \sin^2 A - \cos^2 A$.

20. $\sec A - \cos A = \sin A \tan A$.

21. $\csc A - \sin A = \cos A \cot A$.

$$22. \ \frac{\cos A}{1-\sin A} = \frac{1+\sin A}{\cos A}.$$

§ 7. Application of Formulas [1] - [3].

Formulas [1], [2], and [3] enable us, when any one function of an angle is given, to find all the others. A given value of any one function, therefore, determines all the others.

Example 1. Given $\sin A = \frac{2}{3}$; find the other functions.

By [1],
$$\cos A = \sqrt{1-\frac{4}{9}} = \sqrt{\frac{5}{9}} = \frac{1}{3}\sqrt{5}$$
.

By [2],
$$\tan A = \frac{2}{3} \div \frac{1}{3} \sqrt{5} = \frac{2}{3} \times \frac{3}{\sqrt{5}} = \frac{2}{\sqrt{5}}$$

By [3],
$$\cot A = \frac{\sqrt{5}}{2}$$
, $\sec A = \frac{3}{\sqrt{5}}$, $\csc A = \frac{3}{2}$.

Example 2. Given $\tan A = 3$; find the other functions.

By [2],
$$\frac{\sin A}{\cos A} = 3$$
.

And by [1], $\sin^2 A + \cos^2 A = 1$.

If we solve these equations (regarding $\sin A$ and $\cos A$ as two unknown quantities), we find that,

$$\sin A = 3\sqrt{\frac{1}{10}}, \cos A = \sqrt{\frac{1}{10}}.$$

Then by [3], cot
$$A = \frac{1}{3}$$
, sec $A = \sqrt{10}$, csc $A = \frac{1}{3}\sqrt{10}$.

Example 3. Given sec A = m; find the other functions.

By [3],
$$\cos A = \frac{1}{m}$$

By [1],
$$\sin A = \sqrt{1 - \frac{1}{m^2}} = \sqrt{\frac{m^2 - 1}{m^2}} = \frac{1}{m} \sqrt{m^2 - 1}.$$

By [2], [3],
$$\tan A = \sqrt{m^2 - 1}$$
, $\cot A = \frac{1}{\sqrt{m^2 - 1}}$, $\csc A = \frac{m}{\sqrt{m^2 - 1}}$.

EXERCISE VI.

Find the values of the other functions, when

1.
$$\sin A = \frac{1}{13}$$
. 5. $\tan A = \frac{4}{3}$. 9. $\csc A = \sqrt{2}$.

2.
$$\sin A = 0.8$$
. 6. $\cot A = 1$. 10. $\sin A = m$.

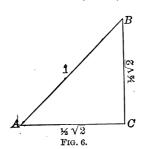

3.
$$\cos A = \frac{60}{61}$$
. 7. $\cot A = 0.5$. 11. $\sin A = \frac{2m}{1+m^2}$

4.
$$\cos A = 0.28$$
. 8. $\sec A = 2$. 12. $\cos A = \frac{2 mn}{m^2 + n^2}$

- 13. Given $\tan 45^{\circ} = 1$; find the other functions of 45°.
- 14. Given $\sin 30^{\circ} = \frac{1}{2}$; find the other functions of 30°.
- 15. Given csc $60^{\circ} = \frac{2}{3}\sqrt{3}$; find the other functions of 60° .
- 16. Given $\tan 15^{\circ} = 2 \sqrt{3}$; find the other functions of 15°.
- 17. Given cot $22^{\circ}30' = \sqrt{2+1}$; find the other functions of $22^{\circ}30'$.
 - 18. Given sin $0^{\circ} = 0$; find the other functions of 0° .
 - 19. Given sin 90°=1; find the other functions of 90°.
 - 20. Given $\tan 90^{\circ} = \infty$; find the other functions of 90°.
- 21. Express the values of all the other functions in terms of $\sin A$.
- 22. Express the values of all the other functions in terms of $\cos A$.
- 23. Express the values of all the other functions in terms of $\tan A$.
- 24. Express the values of all the other functions in terms of $\cot A$.
 - 25. Given $2 \sin A = \cos A$; find $\sin A$ and $\cos A$.
 - 26. Given $4 \sin A = \tan A$; find $\sin A$ and $\tan A$.
 - 27. If $\sin A : \cos A = 9 : 40$, find $\sin A$ and $\cos A$.
- 28. Transform the quantity $\tan^2 A + \cot^2 A \sin^2 A \cos^2 A$ into a form containing only $\cos A$.
 - 29. Prove that $\sin A + \cos A = (1 + \tan A) \cos A$.
 - 30. Prove that $\tan A + \cot A = \sec A \times \csc A$.

§ 8. Functions of 45°.

Let ABC (Fig. 6) be an isosceles right triangle, in which

the length of the hypotenuse AB is equal to 1; then AC is equal to BC, and the angle A is equal to 45° . Since $\overline{AC}^2 + \overline{BC}^2 = 1$, therefore $2\ \overline{AC}^2 = 1$, and $AC = \sqrt{\frac{1}{2}} = \frac{1}{2}\sqrt{2}$. Therefore (§ 2),

$$\sin 45^{\circ} = \cos 45^{\circ} = \frac{1}{2} \sqrt{2}$$
.
 $\tan 45^{\circ} = \cot 45^{\circ} = 1$.
 $\sec 45^{\circ} = \csc 45^{\circ} = \sqrt{2}$.

§ 9. Functions of 30° and 60°.

Let ABC be an equilateral triangle, in which the length of each side is equal to 1; and let CD bisect the angle C. Then CD is perpendicular to AB and bisects AB; hence, $AD = \frac{1}{2}$, and $CD = \sqrt{1 - \frac{1}{4}} = \sqrt{\frac{3}{4}} = \frac{1}{2}\sqrt{3}$.

In the right triangle ADC, the angle $ACD = 30^{\circ}$, and the angle $CAD = 60^{\circ}$. Whence (§ 2),

$$\sin 30^{\circ} = \cos 60^{\circ} = \frac{1}{2}.$$

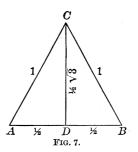

$$\cos 30^{\circ} = \sin 60^{\circ} = \frac{1}{2} \sqrt{3}.$$

$$\tan 30^{\circ} = \cot 60^{\circ} = \frac{1}{\sqrt{3}} = \frac{1}{3} \sqrt{3}.$$

$$\cot 30^{\circ} = \tan 60^{\circ} = \sqrt{3}.$$

$$\sec 30^{\circ} = \csc 60^{\circ} = \frac{2}{\sqrt{3}} = \frac{2}{3} \sqrt{3}.$$

$$\csc 30^{\circ} = \sec 60^{\circ} = 2.$$

The results for sine and cosine of 30°, 45°, and 60° may be easily remembered by arranging them in the following form:

Angle	30°	45°	60°	$\frac{1}{2}\sqrt{1} = 0.5$
Sine	$\frac{1}{2}\sqrt{1}$	$\frac{1}{2}\sqrt{2}$	$\frac{1}{2}\sqrt{3}$	$\frac{1}{2}\sqrt{2} = 0.70711$
Cosine	$\frac{1}{2}\sqrt{3}$	$\frac{1}{2}\sqrt{2}$	$\frac{1}{2}\sqrt{1}$	$\frac{1}{2}\sqrt{3} = 0.86603$

EXERCISE VII.

17.

Solve the following equations:					
1.	$2\cos x = \sec x$.	7. 3	$\tan^2 x - \sec^2 x = 1.$		
2.	$4\sin x = \csc x.$	8.	$\tan x + \cot x = 2.$		
3.	$\tan x = 2 \sin x.$	9.	$\sin^2 x - \cos x = \frac{1}{4}.$		
4.	$\sec x = \sqrt{2} \tan x.$	1 0.	$\tan^2 x - \sec x = 1.$		
5 .	$\sin^2 x = 3 \cos^2 x.$	11.	$\sin x + \sqrt{3}\cos x = 2.$		
6.	$2\sin^2 x + \cos^2 x = \frac{3}{2}.$	12.	$\tan^2 x + \csc^2 x = 3.$		
	13. $2 \cos x + \sec x$	x =	3.		
	14. $\cos^2 x - \sin^2 x$	$x = x^2$	$\sin x$.		
	15. $2 \sin x + \cot x$	t x =	$1+2\cos x$.		
	16. $\sin^2 x + \tan^2 x$	$n^2 x =$	$3\cos^2 x$.		

Note. Wentworth & Hill's Five-place trigonometric and logarithmic tables have full explanations, and directions for using them. Before proceeding to Chapter II. the student should learn how to use these tables.

 $\tan x + 2 \cot x = \frac{5}{2} \csc x.$

Table VI. is to be used in solutions without logarithms. This fourplace table contains the natural functions of angles at intervals of 1'. The decimal point must be inserted before each value given, except where it appears in the values of the table.

CHAPTER II.

THE RIGHT TRIANGLE.

§ 10. THE GIVEN PARTS.

In order to solve a right triangle, two parts besides the right angle must be given, one of them at least being a side.

The two given parts may be:

- I. An acute angle and the hypotenuse.
- II. An acute angle and the opposite leg.
- III. An acute angle and the adjacent leg.
- IV. The hypotenuse and a leg.
- V. The two legs.

§ 11. Solution without Logarithms.

The following examples illustrate the process of solution when logarithms are not employed.

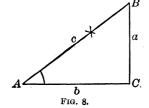

CASE I.

Given $A = 43^{\circ} 17'$, c = 26; find B, a, b.

1.
$$B = 90^{\circ} - A = 46^{\circ} 43'$$
.

2.
$$\frac{a}{c} = \sin A$$
; $\therefore a = c \sin A$.

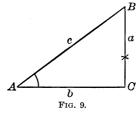

3.
$$\frac{b}{c} = \cos A$$
; $\therefore b = c \cos A$.

TRIGONOMETRY.

CASE II.

Given $A = 13^{\circ} 58'$, a = 15.2; find B, b, c.

1.
$$B = 90^{\circ} - A = 76^{\circ} 2'$$
.

2.
$$\frac{b}{a} = \cot A$$
; $\therefore b = a \cot A$.

3.
$$\frac{a}{c} = \sin A$$
; $\therefore c = \frac{a}{\sin A}$

$$\cot A = 4.0207$$

$$a = \frac{15.2}{80414}$$

$$201035$$

$$40207$$

$$b = 61.11464$$

$$a = 15.2, \sin A = 0.2414$$

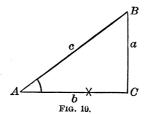

$$0.2414)15.200(62.9)$$

$$\frac{14 \ 484}{7160}$$

$$\frac{4828}{2332}$$

CASE III.

Given $A = 27^{\circ} 12'$, b = 31; find B, a, c.

1.
$$B = 90^{\circ} - A = 62^{\circ} 48'$$
.

2.
$$\frac{a}{b} = \tan A$$
; $\therefore a = b \tan A$.

2.
$$\frac{a}{b} = \tan A$$
; $\therefore a = b \tan A$.
3. $\frac{b}{c} = \cos A$; $\therefore c = \frac{b}{\cos A}$.

 $26\ 682$

4 3180

3 5576

7604

$$tan A = 0.5139
b = 31
5139
a = 15.9309$$

$$b = 31, \cos A = 0.8894
0.8894) 31.000 (34.8)
26 682
4 3180
2 3 5576
7604$$

CASE IV.

Given a = 47, c = 63; find A, B, b.

1.
$$\sin A = \frac{a}{c}$$

2. $B = 90^{\circ} - A$.
3. $b = \sqrt{c^2 - a^2} = \sqrt{(c - a)(c + a)}$. A

Fig. 11.

$$\begin{array}{c} a = 47, c = 63 \\ 63)47.0 (0.7460 \\ \underline{441} \\ 290 \\ \underline{252} \\ \sin A = 0.7460 \\ 380 \\ \therefore A = 48^{\circ} 15' \\ B = 41^{\circ} 45' \end{array} \begin{array}{c} c + a = 110 \\ c - a = \underline{16} \\ \overline{660} \\ \underline{110} \\ b^{2} = \overline{1760} \\ b = \sqrt{1760} \\ = 41.95 \end{array}$$

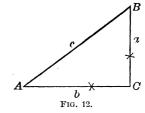

CASE V.

Given a = 121, b = 37; find A, B, c.

1.
$$\tan A = \frac{a}{b}$$

2.
$$B = 90^{\circ} - A$$
.

$$3. c = \sqrt{a^2 + b^2}.$$

§ 12. GENERAL METHOD OF SOLVING THE RIGHT TRIANGLE.

From these five cases it appears that the general method of finding an unknown part in a right triangle is as follows:

Choose from the equation $A+B=90^{\circ}$, and the equations that define the functions of the angles, an equation in which the required part only is unknown; solve this equation, if necessary, to find the value of the unknown part; then compute the value.

Note. In Case IV., if the given sides (here a and c) are nearly alike in value, then A is near 90°, and its value cannot be accurately found from the tables, because the sines of large angles differ little in value (as is evident from Fig. 4). In this case it is better to find B first, by means of a formula proved later. See formula [18], § 30; viz.,

$$\tan \frac{1}{2}B = \sqrt{\frac{c-a}{c+a}}.$$

Example. Given a = 49, c = 50; find A, B, b.

$$c - a = 1, c + a = 99.$$

$$\frac{c - a}{c + a} = 0.01010$$

$$\tan \frac{1}{2}B = 0.1005$$

$$\therefore \frac{1}{2}B = 5^{\circ} 44'$$

$$B = 11^{\circ} 28'$$

$$A = 78^{\circ} 32'$$

$$c - a = 1$$

$$\frac{c + a = 99}{b^{2} = 99}$$

$$b = \sqrt{9}$$

$$= 9.9$$

EXERCISE VIII.

- 1. In Case II. give another way of finding c, after b has been found.
- 2. In Case III. give another way of finding c, after α has been found.
- 3. In Case IV. give another way of finding b, after the angles have been found.
- 4. In Case V. give another way of finding c, after the angles have been found.
 - 5. Given B and c; find A, a, b.
 - 6. Given B and b; find A, a, c.
 - 7. Given B and a; find A, b, c.
 - 8. Given b and c; find A, B, a.

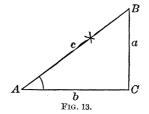

Solve the following right triangles:

	Given.	Required.		
9 10 11 12 13 14 15 16 17 18 19 20	$\begin{array}{cccccccccccccccccccccccccccccccccccc$	$A = 36^{\circ}52', B = 53^{\circ}8', c = 5.$ $A = 28^{\circ}18', B = 61^{\circ}42', b = 10.954.$ $B = 77^{\circ}43', b = 24.342, c = 24.918.$ $A = 46^{\circ}42', b = 9.800, c = 14.290.$ $B = 52^{\circ}18', a = 15.900, b = 20.572.$ $A = 65^{\circ}48', a = 127.694, b = 57.386.$ $A = 34^{\circ}18', B = 55^{\circ}42', a = 12.961.$ $A = 43^{\circ}33', B = 46^{\circ}27', a = 93.139.$ $B = 57^{\circ}46', a = 26.733, c = 50.124.$ $A = 43^{\circ}49', a = 191.900, c = 277.160.$ $A = 68^{\circ}43', B = 21^{\circ}17', c = 101.951.$ $A = 3^{\circ}21', B = 86^{\circ}39', b = 102.825.$ $A = 84^{\circ}52', b = 0.280, c = 3.133$		
22 23 24 25	/	$A = 22^{\circ}37', B = 67^{\circ}23', a = 5, c = 13.$ $A = 82^{\circ}18', B = 7^{\circ}42', a = 7.928,$		
		$\begin{array}{cccccccccccccccccccccccccccccccccccc$		

§ 13. Solution by Logarithms.

CASE I.

Given $A = 34^{\circ}28'$, c = 18.75; find B, a, b.

1.
$$B = 90^{\circ} - A = 55^{\circ} 32'$$
.

2.
$$\frac{a}{c} = \sin A$$
; $\therefore a = c \sin A$.

3.
$$\frac{b}{c} = \cos A; \therefore b = c \cos A.$$

$$\log a = \log c + \log \sin A$$

$$\log c = 1.27300$$

$$\log \sin A = 9.75276 - 10$$

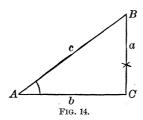

$$\log a = 1.02576$$

$$\alpha = 10.61$$

$$\begin{array}{lll} \log b & = \log c + \log \cos A \\ \log c & = 1.27300 \\ \log \cos A = & \frac{9.91617 - 10}{1.18917} \\ b & = 15.459 \end{array}$$

CASE II.

Given $A = 62^{\circ} 10'$, a = 78; find B, b, c.

1.
$$B = 90^{\circ} - A = 27^{\circ} 50'$$
.

2.
$$\frac{b}{a} = \cot A$$
; $\therefore b = a \cot A$

3.
$$\frac{a}{c} = \sin A$$

2.
$$\frac{b}{a} = \cot A$$
; $\therefore b = a \cot A$.
3. $\frac{a}{c} = \sin A$.
 $\therefore a = c \sin A$, and $c = \frac{a}{\sin A}$.

$$\begin{array}{lll} \log b & = \log a + \log \cot A \\ \log a & = 1.89209 \\ \log \cot A & = 9.72262 - 10 \\ \log b & = 1.61471 \\ b & = 41.182 \end{array}$$

$$\begin{vmatrix} \log c & = \log a + \operatorname{colog} \sin A \\ \log a & = 1.89209 \\ \operatorname{colog} \sin A = 0.05340 \\ \log c & = 1.94549 \\ c & = 88.204 \end{vmatrix}$$

CASE III.

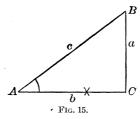

Given $A = 50^{\circ} 2'$, b = 88; find B, a, c.

1.
$$B = 90^{\circ} - A = 39^{\circ} 58'$$
.

2.
$$\frac{a}{b} = \tan A$$
; $\therefore a = b \tan A$.

3.
$$\frac{b}{c} = \cos A.$$

$$\therefore b = c \cos A$$
, and $c = \frac{b}{\cos A}$

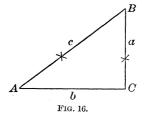

CASE IV.

Given c = 58.40, a = 47.55; find A, B, b.

1.
$$\sin A = \frac{a}{c}$$

2.
$$B = 90^{\circ} - A$$
.

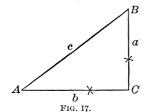

3.
$$\frac{b}{a} = \cot A$$
; $\therefore b = a \cot A$.

$$\begin{aligned} \log \sin A &= \log a + \operatorname{colog} c \\ \log a &= 1.67715 \\ \operatorname{colog} c &= 8.23359 - 10 \\ \log \sin A &= 9.91074 - 10 \\ A &= 54^{\circ} 31' \\ B &= 35^{\circ} 29' \end{aligned}$$

CASE V.

Given a = 40, b = 27; find A, B, c.

1.
$$\tan A = \frac{a}{b}$$
.
2. $B = 90^{\circ} - A$.
3. $\frac{a}{c} = \sin A$.

2.
$$B = 90^{\circ} - A$$

3.
$$\frac{a}{c} = \sin A$$
.

$$\therefore a = c \sin A; \quad \therefore c = \frac{a}{\sin A}.$$

$$\begin{aligned} \log \tan A &= \log a + \operatorname{colog} b \\ \log a &= 1.60206 \\ \operatorname{colog} b &= 8.56864 - 10 \\ \log \tan A &= 10.17070 - 10 \\ A &= 55^{\circ} 59' \\ B &= 34^{\circ} 1' \end{aligned}$$

$$\begin{array}{lll} \log c & = \log a + \operatorname{colog} \sin A \\ \log a & = 1.60206 \\ \operatorname{colog} \sin A = & 0.08152 \\ \log c & = & 1.68358 \\ c & = 48.259 \end{array}$$

Note. In Cases IV. and V. the unknown side may also be found from the equations

(for Case IV.)
$$b = \sqrt{c^2 - a^2} = \sqrt{(c+a)(c-a)};$$
 (for Case V.)
$$c = \sqrt{a^2 + b^2}.$$

These equations express the values of b and c directly in terms of the two given sides; and if the values of the sides are simple numbers (e.g. 5, 12, 13), it is often easier to find b or \acute{c} in this way. But this value of c is not adapted to logarithms, and this value of b is not so readily worked out by logarithms as the value of b given under Case IV. See also § 12, Note.

§ 14. Area of the Right Triangle.

It is shown in Geometry that the area of a triangle is equal to one-half the product of the base by the altitude.

Therefore, if a and b denote the legs of a right triangle, and F the area, $F = \frac{1}{2}ab$.

By means of this formula the area may always be found when a and b are given or have been computed.

For example: Find the area, having given:

```
Case I. (§ 13).
                                            Case IV. (§ 13).
  A = 34^{\circ}28', c = 18.75.
                                       a = 47.54, c = 58.40.
  First find (as in § 13) \log a
                                       First find (as in § 13) \log a
and \log b.
                                     and \log b.
\log F \!=\! \log a \!+\! \log b \!+\! \operatorname{colog} 2
                                    \log F = \log a + \log b + \operatorname{colog} 2
      \log a = 1.02578
                                            \log a = 1.67715
      \log b = 1.18915
                                            \log b = 1.53025
                                            colog 2 = 9.69897 - 10
      colog 2 = 9.69897 - 10
       \log F = \overline{1.91390}
                                             \log F = 2.90637
      F
             =82.016
                                            F
                                                  =806.06

EXERCISE IX.

Solve the following triangles, finding the angles to the nearest minute:

	GIVEN:		Required:		
2 3 4 5 6	$a = 6,$ $A = 60^{\circ},$ $A = 30^{\circ},$ $a = 4,$ $a = 2,$ $c = 627,$ $c = 2280,$	b = 4. $a = 3$.	$B = 30^{\circ},$ $B = 60^{\circ},$ $A = B = 45^{\circ},$ $A = B = 45^{\circ},$ $B = 66^{\circ} 30',$	b = 2. $a = 250.02,$	a = 6.9282. b = 5.1961.
9 10 11 12 13 14 15	c = 1, c = 200, c = 93.4, a = 637, a = 48.532, a = 0.0008, b = 50.937,	$A = 39^{\circ} 34'.$ $A = 36^{\circ}.$ $B = 21^{\circ} 47'.$ $B = 76^{\circ} 25'.$ $A = 4^{\circ} 35'.$ $A = 36^{\circ} 44'.$ $A = 86^{\circ}.$ $B = 43^{\circ} 48'.$ $B = 3^{\circ} 38'.$	$B = 54^{\circ}, \\ A = 68^{\circ} 13', \\ A = 13^{\circ} 35', \\ B = 85^{\circ} 25', \\ B = 53^{\circ} 16', \\ B = 4^{\circ}, \\ A = 46^{\circ} 12', \\$	a = 45.958, a = 0.58779, a = 185.73, a = 21.936, b = 7946, b = 65.031, b = 0.0000559, a = 53.116, a = 31.497,	c = 73.59.

	GIVEN:	REQUIRED:		
17 18 19 20 21 22 23 24 25 26 27 28 29	$\begin{array}{lll} a=73, & B=68^{\circ}52'.\\ a=2.189, & B=45^{\circ}25'.\\ b=4, & A=37^{\circ}56'.\\ c=8590, & a=4476.\\ c=86.53, & a=71.78.\\ c=9.35, & a=8.49.\\ c=2194, & b=1312.7.\\ c=30.69, & b=18.256.\\ a=38.313, & b=19.522.\\ a=1.2291, & b=14.950.\\ a=415.38, & b=62.080.\\ \end{array}$	$A = 13^{\circ} 41', b = 4074.5, A = 21^{\circ} 8', b = 188.86, A = 44^{\circ} 35', b = 2.2211, B = 52^{\circ} 4', a = 3.1176, A = 31^{\circ} 24', B = 58^{\circ} 36', A = 56^{\circ} 3', B = 33^{\circ} 57', A = 65^{\circ} 14', B = 24^{\circ} 46', A = 53^{\circ} 15', B = 36^{\circ} 45', A = 53^{\circ} 30', B = 36^{\circ} 30', A = 63^{\circ}, B = 27^{\circ}, A = 4^{\circ} 42', B = 85^{\circ} 18', A = 81^{\circ} 30', B = 8^{\circ} 30', A = 38^{\circ} 58', B = 51^{\circ} 2',$	c = 4193.6. $c = 202.47.$ $c = 3.1185.$ $c = 5.0714.$ $b = 7332.8.$ $b = 48.324.$ $b = 3.917.$ $a = 1758.$ $a = 24.67.$ $c = 43.$ $c = 15.$ $c = 420.$ $c = 21.769.$	
30	c = 91.92, a = 2.19.	$A = 1^{\circ}22', B = 88^{\circ}38',$	b = 91.894.	

Compute the unknown parts and also the area, having given:

- $A = 69^{\circ} 54'$. 31. a = 5, b = 6. 36. c = 68, 32. a = 0.615, c = 70.37. c = 27, $B = 44^{\circ} 4'$. 38. a = 47, 33. $b = \sqrt[3]{2}$, $c = \sqrt{3}$. $B = 48^{\circ} 49'$. 39. b = 9, $B = 34^{\circ} 44'$. 34. a = 7, $A = 18^{\circ} 14'$. 40. $c = 8.462, B = 86^{\circ} 4'$. $A = 29^{\circ} 8'$. 35. b = 12,
- 41. Find the value of F in terms of c and A.
- 42. Find the value of F in terms of a and A.
- 43. Find the value of F in terms of b and A.
- 44. Find the value of F in terms of a and c.
- 45. Given F = 58, a = 10; solve the triangle.
- 46. Given F=18, b=5; solve the triangle.
- 47. Given F=12, $A=29^{\circ}$; solve the triangle.
- 48. Given F=100, c=22; solve the triangle. 49. Find the angles of a right triangle if the hypote
- 49. Find the angles of a right triangle if the hypotenuse is equal to three times one of the legs.

- 50. Find the legs of a right triangle if the hypotenuse = 6, and one angle is twice the other.
 - 51. In a right triangle given c, and A = nB; find a and b.
- 52. In a right triangle the difference between the hypotenuse and the greater leg is equal to the difference between the two legs; find the angles.

The angle of elevation of an object (or angle of depression, if the object is below the level of the observer) is the angle which a line from the eye to the object makes with a horizontal line in the same vertical plane.

- 53. At a horizontal distance of 120 feet from the foot of a steeple, the angle of elevation of the top was found to be 60° 30′; find the height of the steeple.
- 54. From the top of a rock that rises vertically 326 feet out of the water, the angle of depression of a boat was found to be 24°; find the distance of the boat from the foot of the rock.
- 55. How far is a monument, in a level plain, from the eye, if the height of the monument is 200 feet and the angle of elevation of the top 3° 30′?
- 56. In order to find the breadth of a river a distance AB is measured along the bank, the point A being directly opposite a tree C on the other side. The angle ABC is also measured. If AB is 96 feet, and ABC is 21° 14′ find the breadth of the river.
 - If ABC were 45°, what would be the breadth of the river?
- 57. Find the angle of elevation of the sun when a tower a feet high casts a horizontal shadow b feet long. Find the angle when a = 120, b = 70.
- 58. How high is a tree that casts a horizontal shadow b feet in length when the angle of elevation of the sun is A° ? Find the height of the tree when b=80, $A=50^{\circ}$.

- 59. What is the angle of elevation of an inclined plane if it rises 1 foot in a horizontal distance of 40 feet?
- 60. A ship is sailing due north-east with a velocity of 10 miles an hour. Find the rate at which she is moving due north, and also due east.
- 61. In front of a window 20 feet high is a flower-bed 6 feet wide. How long must a ladder be to reach from the edge of the bed to the window?
- 62. A ladder 40 feet long may be so placed that it will reach a window 33 feet high on one side of the street, and by turning it over without moving its foot it will reach a window 21 feet high on the other side. Find the breadth of the street.
- 63. From the top of a hill the angles of depression of two successive milestones, on a straight level road leading to the hill, are observed to be 5° and 15°. Find the height of the hill.
- 64. A fort stands on a horizontal plain. The angle of elevation at a certain point on the plain is 30°, and at a point 100 feet nearer the fort it is 45°. How high is the fort?
- 65. From a certain point on the ground the angles of elevation of the belfry of a church and of the top of the steeple were found to be 40° and 51° respectively. From a point 300 feet farther off, on a horizontal line, the angle of elevation of the top of the steeple is found to be 33° 45′. Find the distance from the belfry to the top of the steeple.
- 66. The angle of elevation of the top C of an inaccessible fort observed from a point A, is 12°. At a point B, 219 feet from A and on a line AB perpendicular to AC, the angle ABC is 61° 45′. Find the height of the fort.

31

§ 15. THE ISOSCELES TRIANGLE.

An isosceles triangle is divided by the perpendicular from the vertex to the base into two equal right triangles.

Therefore, an isosceles triangle is determined by any two parts that determine one of these right triangles.

Let the parts of an isosceles triangle ABC (Fig. 18), among which the altitude CD is to be included, be denoted as follows:

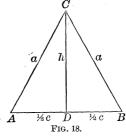

a = one of the equal sides,

c =the base,

h =the altitude,

A = one of the equal angles,

C = the angle at the vertex.

For example: Given a and c; re- A $\stackrel{\checkmark}{\sim} c$ D $\stackrel{\checkmark}{\sim}$ quired A, C, h.

1.
$$\cos A = \frac{\frac{1}{2}c}{a} = \frac{c}{2a}$$
.

2.
$$C + 2A = 180^{\circ}$$
; $C = 180^{\circ} - 2A = 2(90^{\circ} - A)$.

3. h may be found by any one of the equations:

$$h^2 + \frac{c^2}{4} = a^2; \quad \frac{h}{a} = \sin A; \quad \frac{h}{\frac{1}{2}c} = \tan A;$$

whence
$$h = \sqrt{(a - \frac{1}{2}c)(a + \frac{1}{2}c)}$$
; $= a \sin A$; $= \frac{1}{2}c \tan A$.

The area F of the triangle may be found, when c and h are given or have been computed, by means of the formula

$$F=\frac{1}{2}ch$$
.

EXERCISE X.

Solve the following isosceles triangles, finding the angles to the nearest second:

- 1. Given α and A; find C, c, h.
- 2. Given a and C; find A, c, h.
- 3. Given c and A; find C, a, h.
- 4. Given c and C; find A, a, h.
- 5. Given h and A; find C, a, c.
- 6. Given h and C; find A, α , c.
- 7. Given a and h; find A, C, c.
- 8. Given c and h; find A, C, a.
- 9. Given a = 14.3, c = 11; find A, C, h.
- 10. Given a = 0.295, $A = 68^{\circ} 10'$; find c, h, F.
- 11. Given c = 2.352, $C = 69^{\circ} 49'$; find a, h, F.
- 12. Given h = 7.4847, $A = 76^{\circ}$ 14'; find a, c, F.
- 13. Given a = 6.71, h = 6.60; find A, C, c.
- 14. Given c = 9, h = 20; find A, C, a.
- 15. Given c = 147, F = 2572.5; find A, C, a, h.
- 16. Given h = 16.8, F = 43.68; find A, C, a, c.
- 17. Find the value of F in terms of a and c.
- 18. Find the value of F in terms of a and C.
- 19. Find the value of F in terms of a and A.
- 20. Find the value of F in terms of h and C.
- 21. A barn is 40×80 feet, the pitch of the roof is 45° ; find the length of the rafters and the area of both sides of the roof.
- 22. In a unit circle what is the length of the chord corresponding to the angle 45° at the centre?
- 23. If the radius of a circle is 30, and the length of a chord is 44, find the angle at the centre.
- 24. Find the radius of a circle if a chord whose length is 5 subtends at the centre an angle of 133°.

25. What is the angle at the centre of a circle if the corresponding chord is equal to $\frac{2}{3}$ of the radius?

26. Find the area of a circular sector if the radius of the circle = 12, and the angle of the sector $= 30^{\circ}$.

§ 16. THE REGULAR POLYGON.

Lines drawn from the centre of a regular polygon (Fig. 19) to the vertices are radii of the circumscribed circle; and lines drawn from the centre to the middle points of the sides are radii of the inscribed circle. These lines divide the polygon into equal right triangles. Therefore, a regular polygon is determined by a right triangle whose sides are the radius of the circumscribed circle, the radius of the inscribed circle, and half of one side of the polygon.

If the polygon has n sides, the angle of this right triangle at the centre is equal to

$$\frac{1}{2}\left(\frac{360^{\circ}}{n}\right)$$
 or $\frac{180^{\circ}}{n}$.

If, also, a side of the polygon, or one of the above-mentioned radii, is given, this triangle may be solved, and the solution gives the unknown parts of the polygon.

Let.

n = number of sides,

c =length of one side,

r = radius of circumscribed circle,

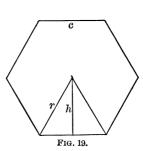

h = radius of inscribed circle,

p =the perimeter,

F =the area.

Then, by Geometry,

$$F = \frac{1}{2} hp$$
.

EXERCISE XI.

- 1. Given n = 10, c = 1; find r, h, F.
- 2. Given n = 12, p = 70; find r, h, F.
- 3. Given n = 18, r = 1; find h, p, F.
- 4. Given n = 20, r = 20; find h, c, F.
- 5. Given n=8, h=1; find r, c, F.
- 6. Given n = 11, F = 20; find r, h, c.
- 7. Given n=7, F=7; find r, h, p.
- 8. Find the side of a regular decagon inscribed in a unit circle.
- 9. Find the side of a regular decagon circumscribed about a unit circle.
- 10. If the side of an inscribed regular hexagon is equal to 1, find the side of an inscribed regular dodecagon.
- 11. Given n and c, and let b denote the side of the inscribed regular polygon having 2n sides; find b in terms of n and c.
- 12. Compute the difference between the areas of a regular octagon and a regular nonagon if the perimeter of each is 16.
- 13. Compute the difference between the perimeters of a regular pentagon and a regular hexagon if the area of each is 12.
- 14. From a square whose side is equal to 1 the corners are cut away so that a regular octagon is left. Find the area of this octagon.
- 15. Find the area of a regular pentagon if its diagonals are each equal to 12.
- 16. The area of an inscribed regular pentagon is 33.8; find the area of a regular polygon of 11 sides inscribed in the same circle.

- 17. The perimeter of an equilateral triangle is 20; find the area of the inscribed circle.
- 18. The area of a regular polygon of 16 sides, inscribed in a circle, is 100; find the area of a regular polygon of 15 sides, inscribed in the same circle.
- 19. A regular dodecagon is circumscribed about a circle, the circumference of which is equal to 1; find the perimeter of the dodecagon.
- 20. The area of a regular polygon of 25 sides is equal to 40; find the area of the ring comprised between the circumferences of the inscribed and the circumscribed circles.

CHAPTER III.

GONIOMETRY.

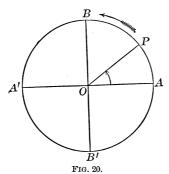

§ 17. Definition of Goniometry.

In order to prepare the way for the solution of an oblique triangle, we now proceed to extend the definitions of the trigonometric functions to angles of all magnitudes, and to deduce certain useful relations of the functions of different angles.

That branch of Trigonometry which treats of trigonometric functions in general, and of their relations, is called Goniometry.

§ 18. Angles of any Magnitude.

Let the radius OP of a circle (Fig. 20) generate an angle by turning about the centre O. This angle will be measured by

the arc described by the point P; and it may have any magnitude, because the arc described by P may have any magnitude.

Let the horizontal line OA be the initial position of OP, and let OP revolve in the direction shown by the arrow, or opposite to the way clock hands revolve. Let, also, the four quadrants into which the circle is divided by the horizontal and vertical diameters

AA', BB', be numbered I., II., IV., in the direction of the motion.

During one revolution OP will form with OA all angles from 0° to 360°. Any particular angle is said to be an angle of the quadrant in which OP lies; so that,

Angles between 0° and 90° are angles of Quadrant I. Angles between 90° and 180° are angles of Quadrant II. Angles between 180° and 270° are angles of Quadrant III. Angles between 270° and 360° are angles of Quadrant IV. If OP make another revolution, it will describe all angles

from 360° to 720°, and so on.

If OP, instead of making another revolution in the direction of the arrow, be supposed to revolve *backwards* about O, this backward motion tends to undo, or cancel, the original forward motion. Hence the angle thus generated must be

this backward motion tends to undo, or cancel, the original forward motion. Hence, the angle thus generated must be regarded as a *negative* angle; and this negative angle may, obviously, have any magnitude. Thus we arrive at the conception of an angle of any magnitude, positive or negative.

§ 19. General Definitions of the Functions.

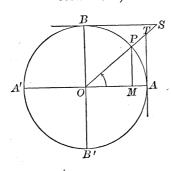

The definitions of the trigonometric functions may be extended to all angles, by making the functions of any angle equal to the line values in a unit circle drawn for the angle in question, as explained in § 4. But the lines that represent the sine, cosine, tangent, and cotangent must be regarded as negative, if they are opposite in direction to the lines that represent the corresponding functions of an angle in the first quadrant; and the lines that represent the secant and cosecant must be regarded as negative, if they are opposite in direction to the moving radius.

Figs. 21-24 show the functions drawn for an angle AOP in each quadrant, taken in order. In constructing them, it must be remembered that the tangents to the circle are always drawn through A and B, never through A' or B'.

Let the angle AOP be denoted by x; then, in each figure,

the *absolute* values of the functions (that is, their values without regard to the signs + and -) are as follows:

 $\sin x = MP$, $\tan x = AT$, $\sec x = OT$, $\cos x = OM$, $\cot x = BS$, $\csc x = OS$.

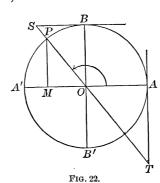

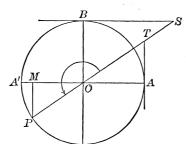

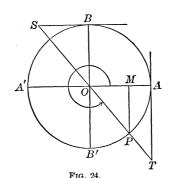

Fig. 21.

Tro 9

Keeping in mind the position of the points A and B, we may define in words the first four functions of the angle x thus:

 $\sin x =$ the vertical projection of the moving radius;

 $\cos x =$ the horizontal projection of the moving radius;

 $\tan x = \begin{cases}
\text{the distance measured along a tangent to the circle} \\
\text{from the beginning of the first quadrant to the} \\
\text{moving radius produced;}
\end{cases}$

 $\cot x = \begin{cases} \text{the distance measured along a tangent to the circle} \\ \text{from the end of the first quadrant to the moving} \\ \text{radius produced.} \end{cases}$

Secx and $\csc x$ are the distances from the centre of the circle measured along the moving radius produced to the tangent and cotangent, respectively.

§ 20. Algebraic Signs of the Functions.

The lengths of the lines, defined above as the functions of any angle, are expressed numerically in terms of the radius of the circle as the unit. But, before these lengths can be treated as algebraic quantities, they must have the sign + or — prefixed, according to the condition stated in § 19.

The reason for this condition lies in that fundamental relation between algebraic and geometric magnitudes, in virtue of which contrary signs in Algebra correspond to opposite directions in Geometry.

The sine MP and the tangent AT always extend from the horizontal diameter, but sometimes upwards and sometimes downwards; the cosine OM and the cotangent BS always extend from the vertical diameter, but sometimes towards the right and sometimes towards the left. The functions of an angle in the first quadrant are assumed to be positive. Therefore,

- 1. Sines and tangents extending from the horizontal diameter *upwards*, are positive; *downwards*, negative;
- 2. Cosines and cotangents extending from the vertical diameter towards the right, are positive; towards the left, are negative.

The signs of the secant and cosecant are always made to agree with those of the cosine and sine, respectively. This agreement is secured if secants and cosecants extending from the centre, in the direction of the moving radius, are considered positive; in the opposite direction, negative.

Hence, the signs of the functions for each quadrant are:

In Quadrant I. all the functions are positive.

In Quadrant II. the sine and cosecant only are positive.

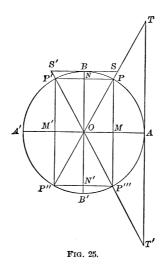

In Quadrant III. the tangent and cotangent only are positive.

In Quadrant IV. the cosine and secant only are positive.

§ 21. Functions of a Variable Angle.

Let the angle x increase continuously from 0° to 360°; what changes will the values of its functions undergo?

It is easy, by reference to Fig. 25, to trace these changes throughout all the quadrants.

1. The Sine. In the first quadrant, the sine MP increases from 0 to 1; in the second it remains positive, and decreases from 1 to 0; in the third it is negative, and increases in absolute value from 0 to 1; in the fourth it is negative, and decreases in absolute value from 1 to 0.

- 2. The Cosine. In the first quadrant, the cosine OM decreases from 1 to 0; in the second it becomes negative, and increases in absolute value from 0 to 1; in the third it is negative, and decreases in absolute value from 1 to 0; in the fourth it is positive, and increases from 0 to 1.
- 3. The Tangent. In the first quadrant, the tangent AT increases from 0 to ∞ ; in the second quadrant, as soon as the angle exceeds 90° by the smallest conceivable amount, the moving radius OP', prolonged in the direction opposite to that of OP', will cut AT at a point T' situated very far below A; hence, the tangents of angles near 90° in the second quadrant have very large negative values. As the angle increases, the tangent AT' continues negative, but diminishes in absolute value. When $x=180^\circ$, then T' coincides with A, and tan $180^\circ=0$. In the third quadrant, the tangent is positive, and increases from 0 to ∞ ; in the fourth it is negative, and decreases in absolute value from ∞ to 0.
- 4. The Cotangent. In the first quadrant, the cotangent BS decreases from ∞ to 0; in the second quadrant it is negative, and increases in absolute value from 0 to ∞ ; in the third and fourth quadrants it has the same sign, and undergoes the same changes as in the first and second quadrants, respectively.
- 5. The Secant. In the first quadrant, the secant OT increases from 1 to ∞ ; in the second it is negative (being measured in the direction opposite to that of OP'), and decreases in absolute value from ∞ to 1; in the third it is negative, and increases in absolute value from 1 to ∞ ; in the fourth it is positive, and decreases from ∞ to 1.
- 6. The Cosecant. In the first quadrant, the cosecant OS decreases from ∞ to 1; in the second it is positive, and increases from 1 to ∞ ; in the third it is negative, and decreases in absolute value from ∞ to 1; in the fourth it is negative, and increases in absolute value from 1 to ∞ .

The limiting values of the functions are as follows:

·	0°	90°	180°	270°	360°
Sine	± 0	1	± 0	— 1	± 0
Cosine	1	± 0	-1	± 0	1
Tangent	± 0	± %	± 0	± &	± 0
Cotangent	± &	± 0	± %	± 0	± 8
Secant	1	± &	-1	± %	1
Cosecant	± 8	1	± 8	-1	± 8

Sines and cosines extend from +1 to -1; tangents and cotangents from $+\infty$ to $-\infty$; secants and cosecants from $+\infty$ to +1, and from -1 to $-\infty$.

In the table given above the double sign \pm is placed before 0 and ∞ . From the preceding investigation it appears that the functions always change sign in passing through 0 and ∞ ; and the sign + or - prefixed to 0 or ∞ simply shows the direction from which the value is reached.

Take, for example, $\tan 90^{\circ}$: The nearer an acute angle is to 90° , the greater the *positive* value of its tangent; and the nearer an obtuse angle is to 90° , the greater the *negative* value of its tangent. When the angle is 90° , OP (Fig. 25) is parallel to AT, and cannot meet it. But $\tan 90^{\circ}$ may be regarded as extending either in the positive or in the negative direction; and according to the view taken, it will be $+\infty$ or $-\infty$.

§ 22. Functions of Angles Larger than 360°.

The functions of $360^{\circ} + x$ are the same in sign and in absolute value as those of x; for the moving radius has the same position in both cases. If n is a positive integer,

The functions of $(n \times 360^{\circ} + x)$ are the same as those of x. For example: The functions of $2200^{\circ}(6 \times 360^{\circ} + 40^{\circ})$ are equal to the functions of 40° .

§ 23. Extension of Formulas [1]-[3] to all Angles.

The Formulas established for *acute* angles in \S 6 hold true for *all* angles. Thus, Formula $\lceil 1 \rceil$,

$$\sin^2 x + \cos^2 x = 1,$$

is universally true; for, whether MP and OM (Fig. 25) are positive or negative, \overline{MP}^2 and \overline{OM}^2 are always positive, and in each quadrant $\overline{MP}^2 + \overline{OM}^2 = \overline{OP}^2 = 1$.

Also,
$$[2] \tan x = \frac{\sin x}{\cos x},$$
and
$$[3] \begin{cases} \sin x \times \csc x = 1, \\ \cos x \times \sec x = 1, \\ \tan x \times \cot x = 1, \end{cases}$$

are universally true; for they are in harmony with the algebraic signs of the functions, given at the end of § 20; and we have in each quadrant from the similar triangles *OMP*, *OAT*, *OBS*, (Fig. 25) the proportions

$$AT : OA = MP : OM$$
,
 $MP : OP = OB : OS$,
 $OM : OP = OA : OT$,
 $AT : OA = OB : BS$,

which, by substituting 1 for the radius, and the right names for the other lines, are easily reduced to the above formulas.

Formulas [1]-[3] enable us, from a given value of one function, to find the absolute values of the other five functions, and also the sign of the reciprocal function. But in order to determine the proper signs to be placed before the other four functions, we must know the quadrant to which the angle in question belongs; or the sign of any one of these four functions; for, by (§ 20) it will be seen that the signs of any two functions that are not reciprocals determine the quadrant to which the angle belongs.

Example. Given $\sin x = +\frac{4}{5}$, and $\tan x$ negative; find the values of the other functions.

Since $\sin x$ is positive, x must be an angle in Quadrants I. or II.; but, since $\tan x$ is negative, Quadrant I. is inadmissible.

By [1],
$$\cos x = \pm \sqrt{1 - \frac{16}{25}} = \pm \frac{3}{5}$$
.

Since the angle is in Quadrant II. the minus sign must be taken, and we have

$$\cos x = -\frac{3}{5}$$
.

By [2] and [3],

$$\tan x = -\frac{4}{3}$$
, $\cot x = -\frac{3}{4}$, $\sec x = -\frac{5}{3}$, $\csc x = \frac{5}{4}$.

EXERCISE XII.

- 1. Construct the functions of an angle in Quadrant II. What are their signs?
- 2. Construct the functions of an angle in Quadrant III. What are their signs?
- 3. Construct the functions of an angle in Quadrant IV. What are their signs?
- 4. What are the signs of the functions of the following angles: 340°, 239°, 145°, 400°, 700°, 1200°, 3800°?
- 5. How many angles less than 360° have the value of the sine equal to $+\frac{\pi}{2}$, and in what quadrants do they lie?
- 6. How many values less than 720° can the angle x have if $\cos x = +\frac{2}{3}$, and in what quadrants do they lie?
- 7. If we take into account only angles less than 180°, how many values can x have if $\sin x = \frac{5}{7}$? if $\cos x = \frac{1}{5}$? if $\cos x = \frac{1}{5}$? if $\cos x = \frac{1}{5}$? if $\cot x = -7$?
- 8. Within what limits must the angle x lie if $\cos x = -\frac{2}{9}$? if $\cot x = 4$? if $\sec x = 80$? if $\csc x = -3$? (if $x < 360^{\circ}$).
- 9. In what quadrant does an angle lie if sin and cosine are both negative? if cosine and tangent are both negative? if the cotangent is positive and the sine negative?

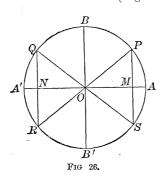

- 10. Between 0° and 3600° how many angles are there whose sines have the absolute value $\frac{3}{5}$? Of these sines how many are positive and how many negative?
- 11. In finding $\cos x$ by means of the equation $\cos x = \pm \sqrt{1 \sin^2 x}$, when must we choose the positive sign and when the negative sign?
- 12. Given $\cos x = -\sqrt{\frac{1}{2}}$; find the other functions when x is an angle in Quadrant II.
- 13. Given $\tan x = \sqrt{3}$; find the other functions when x is an angle in Quadrant III.
- 14. Given see x = +7, and tan x negative; find the other functions of x.
- 15. Given $\cot x = -3$; find all the possible values of the other functions.
- 16. What functions of an angle of a triangle may be negative? In what case are they negative?
- 17. What functions of an angle of a triangle determine the angle, and what functions fail to do so?
- 18. Why may cot 360° be considered equal either to $+\infty$
- 19. Obtain by means of Formulas [1]-[3] the other functions of the angles given:
 - (i.) $\tan 90^{\circ} = \infty$. (iii.
 - (iii.) cot $270^{\circ} = 0$.
 - (ii.) $\cos 180^{\circ} = -1$.
- (iv.) esc $360^{\circ} = -\infty$.
- 20. Find the values of $\sin 450^\circ$, $\tan 540^\circ$, $\cos 630^\circ$, $\cot 720^\circ$, $\sin 810^\circ$, $\csc 900^\circ$.
- 21. For what angle in each quadrant are the absolute values of the sine and cosine equal?

Compute the values of the following expressions:

- 22. $a \sin 0^{\circ} + b \cos 90^{\circ} c \tan 180^{\circ}$.
- 23. $a \cos 90^{\circ} b \tan 180^{\circ} + c \cot 90^{\circ}$.
- 24. $a \sin 90^{\circ} b \cos 360^{\circ} + (a b) \cos 180^{\circ}$.
- 25. $(a^2 b^2) \cos 360^{\circ} 4 \ ab \sin 270^{\circ}$.

§ 24. REDUCTION OF FUNCTIONS TO THE FIRST QUADRANT.

In a unit circle (Fig. 26) draw two diameters PR and QS

equally inclined to the horizontal diameter AA', or so that the angles AOP, A'OQ, A'OR, and AOS shall be equal. From the points P, Q, R, S let fall perpendiculars to AA'; the four right triangles thus formed, with a common vertex at O, are equal; because they have equal hypotenuses (radii of the circle) and equal acute angles at O. There-

fore, the perpendiculars PM, QN, RN, SM, are equal. Now these four lines are the sines of the angles AOP, AOQ, AOR, and AOS, respectively. Therefore, in absolute value,

$$\sin AOP = \sin AOQ = \sin AOR = \sin AOS.$$

And from § 23 it follows that *in absolute value* the cosines of these angles are also equal; and likewise the tangents, the cotangents, the secants, and the cosecants.*

Hence, for every acute angle (AOP) there is an angle in each of the higher quadrants whose functions, in absolute value, are equal to those of this acute angle.

Let $\angle AOP = x$, $\angle POB = y$; then $x + y = 90^{\circ}$, and the functions of x are equal to the co-named functions of y (§ 5);

and
$$\angle AOQ$$
 (in Quadrant II.) = $180^{\circ} - x = 90^{\circ} + y$,

$$\angle AOR$$
 (in Quadrant III.) = $180^{\circ} + x = 270^{\circ} - y$,

$$\angle AOS$$
 (in Quadrant IV.) = $360^{\circ} - x = 270^{\circ} + y$.

Hence, prefixing the proper sign (§ 20), we have:

* In future, secants, cosecants, versed sines, and coversed sines will be disregarded. Secants and cosecants may be found by [3], versed sines and coversed sines by VII. and VIII., page 5, if wanted, but they are seldom used in computations.

Angle in Quadrant II.

```
\sin (180^{\circ} - x) = \sin x. \sin (90^{\circ} + y) = \cos y. \cos (180^{\circ} - x) = -\cos x. \cos (90^{\circ} + y) = -\sin y. \tan (180^{\circ} - x) = -\tan x. \tan (90^{\circ} + y) = -\cot y. \cot (180^{\circ} - x) = -\cot x.
```

Angle in Quadrant III.

```
\sin (180^{\circ} + x) = -\sin x. \sin (270^{\circ} - y) = -\cos y. \cos (180^{\circ} + x) = -\cos x. \cos (270^{\circ} - y) = -\sin y. \tan (180^{\circ} + x) = \tan x. \tan (270^{\circ} - y) = \cot y. \cot (180^{\circ} + x) = \cot x. \cot (270^{\circ} - y) = \tan y.
```

Angle in Quadrant IV.

```
\sin (360^{\circ} - x) = -\sin x. \sin (270^{\circ} + y) = -\cos y.

\cos (360^{\circ} - x) = \cos x. \cos (270^{\circ} + y) = \sin y.

\tan (360^{\circ} - x) = -\tan x. \tan (270^{\circ} + y) = -\cot y.

\cot (360^{\circ} - x) = -\cot x. \cot (270^{\circ} + y) = -\tan y.
```

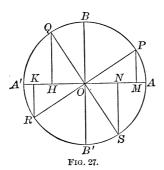

REMARK. The tangents and cotangents may be found directly from the figure, or by formula [2].

It is evident from these formulas,

- 1. The functions of all angles can be reduced to the functions of angles not greater than 45°.
- 2. If an acute angle be added to or subtracted from 180° or 360°, the functions of the resulting angle are equal in absolute value to the like-named functions of the acute angle; but if an acute angle be added to or subtracted from 90° or 270°, the functions of the resulting angle are equal in absolute value to the co-named functions of the acute angle.
- 3. A given value of a sine or cosecant determines two supplementary angles, one acute, the other obtuse; a given value of any other function determines only one angle: acute if the value is positive, obtuse if the value is negative. [See functions of $(180^{\circ}-x)$.]

§ 25. Angles whose Difference is 90°.

The general form of two such angles is x and $90^{\circ} + x$, and they must lie in adjoining quadrants. The relations between

their functions were found in § 24, but only for the case when x is acute. These relations, however, may be shown to hold true for all values of x.

In a unit circle (Fig. 27) draw two diameters PR and QS perpendicular to each other, and let fall to AA' the perpendiculars PM, QH, RK, and SN. The right triangles OMP, OHQ, OKR,

and ONS are equal, because they have equal hypotenuses and equal acute angles POM, OQH, ROK, and OSN.

Therefore,
$$OM = QH = OK = NS$$
, and $PM = OH = KR = ON$.

Hence, taking into account the algebraic sign,

$$\sin AOQ = \cos AOP$$
; $\sin AOS = \cos AOR$;
 $\cos AOQ = -\sin AOP$; $\cos AOS = -\sin AOR$;
 $\sin AOR = \cos AOQ$; $\sin (360^{\circ} + AOP) = \cos AOS$;
 $\cos AOR = -\sin AOQ$; $\cos (360^{\circ} + AOP) = -\sin AOS$.

In all these equations, if x denote the angle on the right-hand side, the angle on the left-hand side will be $90^{\circ} + x$. Therefore, if x be an angle in any one of the four quadrants,

$$\sin (90^{\circ} + x) = \cos x,$$
 $\tan (90^{\circ} + x) = -\cot x,$
 $\cos (90^{\circ} + x) = -\sin x,$ $\cot (90^{\circ} + x) = -\tan x.$

In like manner, it can be shown that all the formulas of $\S 24$ hold true, whatever be the values of the angles x and y.

Hence, in every case the algebraic sign of the function of the resulting angle will be the same as when x and y are both acute.

§ 26. Functions of a Negative Angle.

If the angle AOP (Fig. 26) is denoted by x, the equal angle AOS, generated by a backward rotation of the moving radius from the initial position OA, will be denoted by -x. It is obvious that the position OS of the moving radius for this angle is identical with its position for the angle $360^{\circ}-x$. Therefore, the functions of the angle -x are the same as those of the angle $360^{\circ}-x$; or (§ 24),

$$\sin(-x) = -\sin x,$$
 $\tan(-x) = -\tan x,$
 $\cos(-x) = \cos x,$ $\cot(-x) = -\cot x,$

EXERCISE XIII.

1. Express $\sin 250^{\circ}$ in terms of the functions of an acute angle less than 45°.

Ans.
$$\sin 250^{\circ} = \sin (270^{\circ} - 20^{\circ}) = -\cos 20^{\circ}$$
.

Express the following functions in terms of the functions of angles less than 45° :

2.	sin 172°.	8.	sin 204°.	14.	sin 163° 49′.
3.	$\cos 100^{\circ}$.	9.	$\cos 359^{\circ}$.	15.	$\cos 195^{\circ} 33'$.
4.	$\tan 125^{\circ}$.	10.	$\tan 300$ °.	16.	$\tan 269^{\circ} 15'$.
5.	cot 91°.	11.	cot 264°.	17.	cot 139° 17′.
6.	$\sec 110^{\circ}$.	12.	$\sec 244^{\circ}$.	18.	sec $299^{\circ} 45'$.
7.	$\csc 157^{\circ}$.	13.	csc 271°.	19.	esc 92° 25′.

Express all the functions of the following negative angles in terms of those of positive angles less than 45° :

$$20. -75^{\circ}$$
. $22. -200^{\circ}$. $24. -52^{\circ}37'$. $21. -127^{\circ}$. $23. -345^{\circ}$. $25. -196^{\circ}54'$.

26. Find the functions of 120°.

Hint. $120^{\circ} = 180 - 60^{\circ}$, or, $120^{\circ} = 90^{\circ} + 30^{\circ}$; then apply § 24.

Find the functions of the following angles:

- 27. 135°. 29. 210°. 31. 240°. 33. -30°.
- 28. 150°. 30. 225°. 32. 300°. 34. -225°.
- 35. Given $\sin x = -\sqrt{\frac{1}{2}}$, and $\cos x$ negative; find the other functions of x, and the value of x.
- 36. Given $\cot x = -\sqrt{3}$, and x in Quadrant II.; find the other functions of x, and the value of x.
 - 37. Find the functions of 3540°.
- 38. What angles less than 360° have a sine equal to $-\frac{1}{2}$? a tangent equal to $-\sqrt{3}$?
- 39. Which of the angles mentioned in Examples 27-34 have a cosine equal to $-\sqrt{\frac{1}{2}}$? a cotangent equal to $-\sqrt{3}$?
- 40. What values of x between 0° and 720° will satisfy the equation $\sin x = \pm \frac{1}{2}$?
- 41. Find the other angle between 0° and 360° for which the corresponding function (sign included) has the same value as $\sin 12^\circ$, $\cos 26^\circ$, $\tan 45^\circ$, $\cot 72^\circ$; $\sin 191^\circ$, $\cos 120^\circ$, $\tan 244^\circ$, $\cot 357^\circ$.
 - 42. Given $\tan 238^{\circ} = 1.6$; find $\sin 122^{\circ}$.
 - 43. Given $\cos 333^{\circ} = 0.89$; find $\tan 117^{\circ}$.

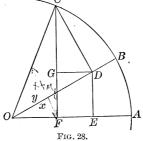

Simplify the following expressions:

- 44. $a \cos(90^{\circ} x) + b \cos(90^{\circ} + x)$.
- 45. $m \cos (90^{\circ} x) \sin (90^{\circ} x)$.
- 46. $(a-b)\tan(90^{\circ}-x)+(a+b)\cot(90^{\circ}+x)$.
- 47. $a^2 + b^2 2ab \cos(180^\circ x)$.
- 48. $\sin(90^{\circ} + x)\sin(180^{\circ} + x) + \cos(90^{\circ} + x)\cos(180^{\circ} x)$.
- 49. $\cos(180^{\circ}+x)\cos(270^{\circ}-y)-\sin(180^{\circ}+x)\sin(270^{\circ}-y)$.
- 50. $\tan x + \tan (-y) \tan (180^{\circ} y)$.
- 51. For what values of x is the expression $\sin x + \cos x$ positive, and for what values negative? Represent the result by shading the sectors corresponding to the negative values.
 - 52. Answer the question of last example for $\sin x \cos x$.
 - 53. Find the functions of $(x-90^{\circ})$ in functions of x.
 - 54. Find the functions of $(x-180^{\circ})$ in functions of x.

§ 27. Functions of the Sum of Two Angles.

In a unit circle (Fig. 28) let the angle AOB = x, the angle BOC = y; then the angle AOC = x + y.

In order to express $\sin(x+y)$ and $\cos(x+y)$ in terms of the sines and cosines of x and y, draw $CF \perp OA$, $CD \perp OB$, $DE \perp OA$, $DG \perp CF$; then $CD = \sin y$, $OD = \cos y$, and the angle $DCG = \cot y$ the angle GDO = x. Also,

$$\sin(x+y) = CF = DE + CG.$$

$$\frac{DE}{OD} = \sin x$$
; hence, $DE = \sin x \times OD = \sin x \cos y$.

$$\frac{CG}{CD} = \cos x$$
; hence, $CG = \cos x \times CD = \cos x \sin y$.

Therefore,
$$\sin(x+y) = \sin x \cos y + \cos x \sin y$$
. [4]

Again,
$$\cos(x+y) = OF = OE - DG$$
.

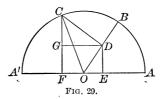

$$\frac{OE}{OD} = \cos x;$$
 hence, $OE = \cos x \times OD = \cos x \cos y$.

$$\frac{DG}{CD} = \sin x$$
; hence, $DG = \sin x \times CD = \sin x \sin y$.

Therefore,
$$\cos(x+y) = \cos x \cos y - \sin x \sin y$$
.

In this proof x and y, and also the sum x + y, are assumed

to be acute angles. If the sum x+y of the acute angles x and y is obtuse, as in Fig. 29, the proof remains, word for word, the same as above, the only difference being that the sign of OF will be negative, as DG is

now greater than OE. The above formulas, therefore, hold true for all acute angles x and y.

If these formulas hold true for any two acute angles x and y, they hold true when one of the angles is increased by 90°. Thus, if for x we write $x' = 90^{\circ} + x$, then, by § 25,

$$\sin(x'+y) = \sin(90^{\circ} + x + y) = \cos(x+y),$$

$$\cos(x'+y) = \cos(90^{\circ} + x + y) = -\sin(x+y).$$

Hence, by [5],
$$\sin(x'+y) = \cos x \cos y - \sin x \sin y$$
, by [4], $\cos(x'+y) = -\sin x \cos y - \cos x \sin y$.

Now, by § 25,
$$\cos x = \sin(90^{\circ} + x) = \sin x'$$
, $\sin x = -\cos(90^{\circ} + x) = -\cos x'$.

Substitute these values of $\cos x$ and $\sin x$, then

$$\sin (x'+y) = \sin x' \cos y + \cos x' \sin y,$$

$$\cos (x'+y) = \cos x' \cos y - \sin x' \sin y.$$

It follows that Formulas [4] and [5] hold true if either angle is repeatedly increased by 90°; therefore they apply to all angles whatever.

By § 23,
$$\tan(x+y) = \frac{\sin(x+y)}{\cos(x+y)} = \frac{\sin x \cos y + \cos x \sin y}{\cos x \cos y - \sin x \sin y}.$$

If we divide each term of the numerator and denominator of the last fraction by $\cos x \cos y$, and again apply § 23, we obtain

$$\tan(x+y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}.$$
 [6]

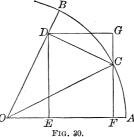

In like manner, by dividing each term of the numerator and denominator of the value of $\cot(x+y)$ by $\sin x \sin y$, we obtain

$$\cot(x+y) = \frac{\cot x \cot y - 1}{\cot y + \cot x}.$$
 [7]

§ 28. Functions of the Difference of Two Angles.

In a unit circle (Fig. 30) let the angle AOB = x, COB = y; then the angle AOC = x - y.

In order to express $\sin(x-y)$ and $\cos(x-y)$ in terms of the sines and cosines of x and y, draw $CF \perp OA$, $CD \perp OB$, $DE \perp OA$, $DG \perp FC$ prolonged; then $CD = \sin y$, $OD = \cos y$, and the angle $DCG = \tan x$. And, $\sin(x-y) = CF = DE - CG$.

$$\frac{DE}{OD} = \sin x; \text{ hence, } DE = \sin x \times OD = \sin x \cos y.$$

$$\frac{CG}{CD} = \cos x; \text{ hence, } CG = \cos x \times CD = \cos x \sin y.$$

Therefore,
$$\sin(x-y) = \sin x \cos y - \cos x \sin y$$
. [8]

Again,
$$\cos(x-y) = OF = OE + DG$$
.

$$\frac{OE}{OD} = \cos x$$
; hence, $OE = \cos x \times OD = \cos x \cos y$.

$$\frac{DG}{CD} = \sin x$$
; hence, $DG = \sin x \times CD = \sin x \sin y$.

Therefore,
$$\cos(x-y) = \cos x \cos y + \sin x \sin y$$
. [9]

In this proof, both x and y are assumed to be acute angles; but, whatever be the values of x and y, the same method of proof will always lead to Formulas [8] and [9], when due regard is paid to the algebraic signs.

The general application of these formulas may be at once shown by deducing them from the general formulas established in § 27, as follows:

It is obvious that (x-y)+y=x. If we apply Formulas [4] and [5] to (x-y)+y, then

$$\sin \{(x-y)+y\}$$
 or $\sin x = \sin (x-y)\cos y + \cos (x-y)\sin y$, $\cos \{(x-y)+y\}$ or $\cos x = \cos (x-y)\cos y - \sin (x-y)\sin y$.

Multiply the first equation by $\cos y$, the second by $\sin y$,

$$\sin x \cos y = \sin (x - y) \cos^2 y + \cos (x - y) \sin y \cos y,$$

$$\cos x \sin y = -\sin (x - y) \sin^2 y + \cos (x - y) \sin y \cos y;$$

whence, by subtraction,

$$\sin x \cos y - \cos x \sin y = \sin (x - y) (\sin^2 y + \cos^2 y).$$

But
$$\sin^2 y + \cos^2 y = 1$$
; therefore, by transposing, $\sin(x-y) = \sin x \cos y - \cos x \sin y$.

Again, if we multiply the first equation by $\sin y$, the second equation by $\cos y$, and add the results, we obtain, by reducing,

$$\cos(x-y) = \cos x \cos y + \sin x \sin y.$$

Therefore, Formulas [8] and [9], like [4] and [5], from which they have been derived, are universally true.

From [8] and [9], by proceeding as in § 27, we obtain

$$\tan(x-y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}.$$
 [10]

$$\cot(x-y) = \frac{\cot x \cot y + 1}{\cot y - \cot x}.$$
 [11]

Formulas $\lceil 4 \rceil - \lceil 11 \rceil$ may be combined as follows:

$$\sin(x \pm y) = \sin x \cos y \pm \cos x \sin y$$
,

$$\cos(x \pm y) = \cos x \cos y \mp \sin x \sin y,$$

$$\tan(x \pm y) = \frac{\tan x \pm \tan y}{1 \mp \tan x \tan y},$$

$$\cot (x \pm y) = \frac{\cot x \cot y \mp 1}{\cot y \pm \cot x}.$$

§ 29. Functions of Twice an Angle.

If y = x, Formulas [4]-[7], become

$$\sin 2x = 2 \sin x \cos x$$
. [12] $\cos 2x = \cos^2 x - \sin^2 x$. [13]

$$\tan 2 x = \frac{2 \tan x}{1 - \tan^2 x} \quad [14] \quad \cot 2 x = \frac{\cot^2 x - 1}{2 \cot x} \quad [15]$$

By these formulas the functions of twice an angle are found when the functions of the angle are given.

§ 30. Functions of Half an Angle.

Take the formulas

Whence

$$\sin x = \pm \sqrt{\frac{1 - \cos 2x}{2}}, \quad \cos x = \pm \sqrt{\frac{1 + \cos 2x}{2}}.$$

These values, if z is put for 2x, and hence $\frac{1}{2}z$ for x, become

$$\sin \frac{1}{2}z = \pm \sqrt{\frac{1 - \cos z}{2}}$$
 [16] $\cos \frac{1}{2}z = \pm \sqrt{\frac{1 + \cos z}{2}}$ [17]

Hence, by division (§ 23),

$$\tan \frac{1}{2}z = \pm \sqrt{\frac{1 - \cos z}{1 + \cos z}}$$
 [18] $\cot \frac{1}{2}z = \pm \sqrt{\frac{1 + \cos z}{1 - \cos z}}$ [19]

By these formulas the functions of half an angle may be computed when the cosine of the entire angle is given.

The proper sign to be placed before the root in each case depends on the quadrant in which the angle $\frac{1}{2}z$ lies. (§ 20.)

Let the student show from Formula [18] that

$$\tan \frac{1}{2} B = \sqrt{\frac{c-a}{c+a}}$$
 (See page 22, Note.)

§ 31. Sums and Differences of Functions.

From [4], [5], [8], and [9], by addition and subtraction:

$$\sin(x+y) + \sin(x-y) = 2\sin x \cos y,$$

$$\sin(x+y) - \sin(x-y) = 2\cos x \sin y,$$

$$\cos(x+y) + \cos(x-y) = 2\cos x \cos y,$$

$$\cos(x+y) - \cos(x-y) = -2\sin x \sin y;$$

or, by making x + y = A, and x-y=B, and therefore, $x = \frac{1}{2}(A+B)$, and $y = \frac{1}{2}(A-B)$,

$$\sin \mathbf{A} + \sin \mathbf{B} = 2\sin \frac{1}{2}(\mathbf{A} + \mathbf{B})\cos \frac{1}{2}(\mathbf{A} - \mathbf{B}). \quad \lceil 20 \rceil$$

$$\sin \mathbf{A} - \sin \mathbf{B} = 2\cos \frac{1}{2}(\mathbf{A} + \mathbf{B})\sin \frac{1}{2}(\mathbf{A} - \mathbf{B}). \quad [21]$$

$$\cos A + \cos B = 2 \cos \frac{1}{2} (A + B) \cos \frac{1}{2} (A - B).$$
 [22]

$$\cos A - \cos B = -2 \sin \frac{1}{2} (A + B) \sin \frac{1}{2} (A - B).$$
 [23]

From [20] and [21], by division, we obtain

$$\frac{\sin A + \sin B}{\sin A - \sin B} = \tan \frac{1}{2} (A + B) \cot \frac{1}{2} (A - B);$$

or, since

$$\cot \frac{1}{2}(A-B) = \frac{1}{\tan \frac{1}{2}(A-B)}$$

$$\frac{\sin \mathbf{A} + \sin \mathbf{B}}{\sin \mathbf{A} - \sin \mathbf{B}} = \frac{\tan \frac{1}{2} (\mathbf{A} + \mathbf{B})}{\tan \frac{1}{2} (\mathbf{A} - \mathbf{B})}.$$
 [24]

13. -y.

EXERCISE XIV.

- 1. Find the value of $\sin(x+y)$ and $\cos(x+y)$, when $\sin x$ $=\frac{3}{5}$, $\cos x = \frac{4}{5}$, $\sin y = \frac{5}{13}$, $\cos y = \frac{12}{13}$.
- 2. Find $\sin (90^{\circ} y)$ and $\cos (90^{\circ} y)$ by making $x = 90^{\circ}$ in Formulas [8] and [9].

Find, by Formulas $\lceil 4 \rceil - \lceil 11 \rceil$, the first four functions of:

3.
$$90^{\circ} + y$$
. 8. $360^{\circ} - y$

3.
$$90^{\circ} + y$$
. 8. $360^{\circ} - y$.

 6. $270^{\circ} - y$.
 11. $x - 180^{\circ}$.
 16. $30^{\circ} + y$.

 7. $270^{\circ} + y$.
 12. $x - 270^{\circ}$.
 17. $60^{\circ} - y$.

7.
$$270^{\circ} + y$$
. 12. $x - 270^{\circ}$. 17. $60^{\circ} - y$.

- 18. Find $\sin 3x$ in terms of $\sin x$.
- 19. Find $\cos 3x$ in terms of $\cos x$.
- 20. Given $\tan \frac{1}{2}x = 1$; find $\cos x$.
- 21. Given $\cot \frac{1}{2}x = \sqrt{3}$; find $\sin x$.
- 22. Given $\sin x = 0.2$; find $\sin \frac{1}{2}x$ and $\cos \frac{1}{2}x$.
- 23. Given $\cos x = 0.5$; find $\cos 2x$ and $\tan 2x$.
- 24. Given $\tan 45^{\circ} = 1$; find the functions of $22^{\circ} 30!$.
- 25. Given $\sin 30^{\circ} = 0.5$; find the functions of 15°.
- 26. Prove that $\tan 18^\circ = \frac{\sin 33^\circ + \sin 3^\circ}{\cos 33^\circ + \cos 3^\circ}$

Prove the following formulas:

27.
$$\sin 2x = \frac{2 \tan x}{1 + \tan^2 x}$$

29.
$$\tan \frac{1}{2}x = \frac{\sin x}{1 + \cos x}$$

27.
$$\sin 2x = \frac{2 \tan x}{1 + \tan^2 x}$$
 29. $\tan \frac{1}{2}x = \frac{\sin x}{1 + \cos x}$ 28. $\cos 2x = \frac{1 - \tan^2 x}{1 + \tan^2 x}$ 30. $\cot \frac{1}{2}x = \frac{\sin x}{1 - \cos x}$

30.
$$\cot \frac{1}{2}x = \frac{\sin x}{1 - \cos x}$$

- 31. $\sin \frac{1}{2}x \pm \cos \frac{1}{2}x = \sqrt{1 \pm \sin x}$.
- $\frac{\tan x \pm \tan y}{\cot x \pm \cot y} = \pm \tan x \tan y.$
- 33. $\tan (45^{\circ} x) = \frac{1 \tan x}{1 + \tan x}$

If A, B, C are the angles of a triangle, prove that:

- 34. $\sin A + \sin B + \sin C = 4 \cos \frac{1}{2} A \cos \frac{1}{2} B \cos \frac{1}{2} C$.
- 35. $\cos A + \cos B + \cos C = 1 + 4 \sin \frac{1}{2} A \sin \frac{1}{2} B \sin \frac{1}{2} C$.
- 36. $\tan A + \tan B + \tan C = \tan A \times \tan B \times \tan C$.
- 37. $\cot \frac{1}{2}A + \cot \frac{1}{2}B + \cot \frac{1}{2}C = \cot \frac{1}{2}A \times \cot \frac{1}{2}B \times \cot \frac{1}{2}C$.

Change to forms more convenient for logarithmic computation:

- 38. $\cot x + \tan x$.
- 43. $1 + \tan x \tan y$.
- 39. $\cot x \tan x$.
- 44. $1 \tan x \tan y$.
- 40. $\cot x + \tan y$.
- 45. $\cot x \cot y + 1$.
- 41. $\cot x \tan y$.
- 46. $\cot x \cot y 1$.
- $42. \ \frac{1-\cos 2x}{1+\cos 2x}$
- 47. $\frac{\tan x + \tan y}{\cot x + \cot y}$

§ 32. Anti-Trigonometric Functions.

If y is any trigonometric function of an angle x, then x is said to be the corresponding anti-trigonometric function of y.

Thus, if $y = \sin x$, x is the anti-sine of y, or inverse sine of y. The anti-trigonometric functions of y are written

$$\sin^{-1}y$$
, $\tan^{-1}y$, $\sec^{-1}y$, $vers^{-1}y$, $\cos^{-1}y$, $\cot^{-1}y$, $\csc^{-1}y$, \cdots

These are read, the angle whose sine is y, etc.

For example, $\sin 30^{\circ} = \frac{1}{2}$; hence $30^{\circ} = \sin^{-1} \frac{1}{2}$. Similarly $90^{\circ} = \cos^{-1} 0 = \sin^{-1} 1$; and $45^{\circ} = \tan^{-1} 1 = \sin^{-1} \frac{1}{\sqrt{2}}$; etc.

The symbol $^{-1}$ must not be confused with the exponent -1. Thus $\sin^{-1}x$ is a very different expression from $\frac{1}{\sin x}$, which would be written $(\sin x)^{-1}$. On the Continent of Europe mathematical writers employ the notation $arc \sin$, $arc \cos$, etc., for \sin^{-1} , \cos^{-1} , etc. But the latter symbols are most common in England and America.

There is an important difference between the trigonometric and the anti-trigonometric functions. When an angle is given, its functions are all completely determined; but when one of the functions is given the angle may have any one of an indefinite number of values. Thus, if $\sin y = \frac{1}{2}$, y may be 30°, or 150°, or either of these increased or diminished by any integral multiple of 360° or 2π , but cannot take any other values. Accordingly $\sin^{-1}\frac{1}{2}=30^{\circ}\pm 2n\pi$, or $150^{\circ}\pm 2n\pi$, where n is any positive integer. Similarly, $\tan^{-1}1=45^{\circ}\pm 2n\pi$ or $225^{\circ}+2n\pi$; i.e., $\tan^{-1}1=45^{\circ}\pm n\pi$.

Since one of the angles whose sine is x and one of the angles whose cosine is x together make 90°, and since similar relations hold for the tangent and cotangent, for the secant and cosecant, and for the versed sine and coversed sine, we have

$$\sin^{-1}x + \cos^{-1}x = \frac{\pi}{2}$$
, $\sec^{-1}x + \csc^{-1}x = \frac{\pi}{2}$

$$\tan^{-1}x + \cot^{-1}x = \frac{\pi}{2},$$
 $\operatorname{vers}^{-1}x + \operatorname{covers}^{-1}x = \frac{\pi}{2},$

where it must be understood that each equation is true only for a particular choice of the various possible values of the functions. For example, if x is positive, and if the angles are always taken in the first quadrant, the equations are correct.

EXERCISE XV.

- 1. Find all the values of the following functions: $\sin^{-1}\frac{1}{2}\sqrt{3}$, $\tan^{-1}\frac{1}{3}\sqrt{3}$, $\mathrm{vers}^{-1}\frac{1}{2}$, $\cos^{-1}(-\frac{1}{2}\sqrt{2})$, $\csc^{-1}(\sqrt{2})$, $\tan^{-1}\infty$, $\sec^{-1}2$, $\cos^{-1}(-\frac{1}{2}\sqrt{3})$.
 - 2. Prove that $\sin^{-1}(-x) = -\sin^{-1}x$; $\cos^{-1}(-x) = \pi \cos^{-1}x$.
 - 3. If $\sin^{-1}x + \sin^{-1}y = \pi$, prove that x = y.
 - 4. If $y = \sin^{-1} \frac{1}{3}$, find $\tan y$.
 - 5. Prove that $\cos(\sin^{-1}x) = \sqrt{1-x^2}$.
 - 6. Prove that $\cos(2\sin^{-1}x) = 1 2x^2$.
 - 7. Prove that $\tan(\tan^{-1}x + \tan^{-1}y) = \frac{x+y}{1-xy}$.
 - 8. If $x = \sqrt{\frac{1}{2}}$, find all the values of $\sin^{-1}x + \cos^{-1}x$.
 - 9. Prove that $\tan^{-1}\left(\frac{x}{\sqrt{1-x^2}}\right) = \sin^{-1}x$.
 - 10. Find the value of $\sin(\tan^{-1}\frac{5}{12})$.
 - 11. Find the value of $\cot(2\sin^{-1}\frac{3}{5})$.
 - 12. Find the value of $\sin(\tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{3})$.
 - 13. If $\sin^{-1} x = 2 \cos^{-1} x$, find x.
 - 14. Prove that $\tan(2\tan^{-1}x) = \frac{2x}{1-x^2}$.
 - 15. Prove that $\sin(2\tan^{-1}x) = \frac{2x}{1+x^2}$.

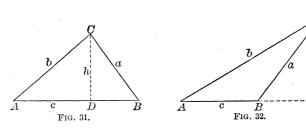

CHAPTER IV.

THE OBLIQUE TRIANGLE.

§ 33. Law of Sines.

Let A, B, C denote the angles of a triangle ABC (Figs. 31 and 32), and a, b, c, respectively, the lengths of the opposite sides.

Draw $CD \perp AB$, and meeting AB (Fig. 31) or AB produced (Fig. 32) at D. Let CD = h.

In both figures, $\frac{h}{b} = \sin A$. In Fig. 31, $\frac{h}{a} = \sin B$. In Fig. 32, $\frac{h}{a} = \sin (180^{\circ} - B) = \sin B$.

Therefore, whether h lies within or without the triangle, we obtain, by division,

$$\frac{\mathbf{a}}{\mathbf{b}} = \frac{\sin \mathbf{A}}{\sin \mathbf{B}}.$$

By drawing perpendiculars from the vertices A and B to the opposite sides we may obtain, in the same way,

$$\frac{b}{c} = \frac{\sin B}{\sin C}, \qquad \frac{a}{c} = \frac{\sin A}{\sin C}.$$

Hence the Law of Sines, which may be thus stated:

The sides of a triangle are proportional to the sines of the opposite angles.

If we regard these three equations as proportions, and take them by alternation, it will be evident that they may be written in the symmetrical form,

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

Note. Each of these equal ratios has a simple geometrical meaning which will appear if the Law of Sines is proved as follows:

Circumscribe a circle about the triangle ABC (Fig. 33),

and draw the radii OA, OB, OC; these radii divide the triangle into three isosceles triangles. Let R denote the radius. Draw $OM \perp BC$. By Geometry, the angle BOC = 2A; hence, the angle BOM = A, then $BM = R\sin BOM = R\sin A$.

 $\therefore BC \text{ or } a = 2R \sin A.$

In like manner, $b = 2R \sin B$, and $c = 2R \sin C$. Whence we obtain

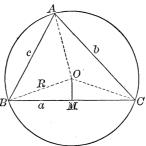

Fig. 33.

$$2R = \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

That is: The ratio of any side of a triangle to the sine of the opposite angle is numerically equal to the diameter of the circumscribed circle.

§ 34. Law of Cosines.

This law gives the value of one side of a triangle in terms of the other two sides and the angle included between them.

In Figs. 31 and 32,
$$a^2 = h^2 + \overline{BD}^2$$
.
In Fig. 31, $BD = c - AD$;
in Fig. 32, $BD = AD - c$;
in both cases, $\overline{BD}^2 = \overline{AD}^2 - 2c \times AD + c^2$.
Therefore, in all cases, $a^2 = h^2 + \overline{AD}^2 + c^2 - 2c \times AD$.
Now, $h^2 + \overline{AD}^2 = b^2$,
and $AD = b \cos A$.
Therefore, $\mathbf{a}^2 = \mathbf{b}^2 + \mathbf{c}^2 - 2\mathbf{b}\mathbf{c}\cos\mathbf{A}$. [26]

In like manner, it may be proved that

$$b^2 = a^2 + c^2 - 2ac \cos B,$$

 $c^2 = a^2 + b^2 - 2ab \cos C.$

The three formulas have precisely the same form, and the law may be stated as follows:

The square of any side of a triangle is equal to the sum of the squares of the other two sides, diminished by twice their product into the cosine of the included angle.

By § 33,
$$a:b=\sin A:\sin B$$
;

whence, by the Theory of Proportion,

$$\frac{a-b}{a+b} = \frac{\sin A - \sin B}{\sin A + \sin B}.$$

But by [24], page 56,

$$\frac{\sin A - \sin B}{\sin A + \sin B} = \frac{\tan \frac{1}{2}(A - B)}{\tan \frac{1}{2}(A + B)}$$

Therefore,

$$\frac{\mathbf{a}-\mathbf{b}}{\mathbf{a}+\mathbf{b}} = \frac{\tan\frac{1}{2}(\mathbf{A}-\mathbf{B})}{\tan\frac{1}{2}(\mathbf{A}+\mathbf{B})}.$$
 [27]

By merely changing the letters,

$$\frac{a-c}{a+c} = \frac{\tan\frac{1}{2}\left(A-C\right)}{\tan\frac{1}{2}\left(A+C\right)}, \qquad \frac{b-c}{b+c} = \frac{\tan\frac{1}{2}\left(B-C\right)}{\tan\frac{1}{2}\left(B+C\right)}$$

Hence the Law of Tangents:

The difference of two sides of a triangle is to their sum as the tangent of half the difference of the opposite angles is to the tangent of half their sum.

Note. If in [27] b>a, then B>A. The formula is still true, but to avoid negative quantities, the formula in this case should be written

$$\frac{b-a}{b+a} = \frac{\tan\frac{1}{2}(B-A)}{\tan\frac{1}{2}(B+A)}.$$

EXERCISE XVI.

- 1. What do the formulas of § 33 become when one of the angles is a right angle?
- 2. Prove by means of the Law of Sines that the bisector of an angle of a triangle divides the opposite side into parts proportional to the adjacent sides.
- 3. What does Formula [26] become when $A = 90^{\circ}$? when $A = 0^{\circ}$? What does the triangle become in each of these cases?

Note. The case where $A=90^\circ$ explains why the theorem of § 34 is sometimes termed the Generalized Theorem of Pythagoras.

- 4. Prove (Figs. 31 and 32) that whether the angle B is acute or obtuse, $c = a \cos B + b \cos A$. What are the two symmetrical formulas obtained by changing the letters? What does the formula become when $B = 90^{\circ}$?
- 5. From the three following equations (found in the last exercise) prove the theorem of § 34:

$$c = a \cos B + b \cos A,$$

 $b = a \cos C + e \cos A,$
 $a = b \cos C + e \cos B.$

Hint. Multiply the first equation by c, the second by b, the third by a; then from the first subtract the sum of the second and third.

- 6. In Formula [27] what is the maximum value of $\frac{1}{2}(A-B)$?
- 7. Find the form to which Formula [27] reduces, and describe the nature of the triangle, when

(i.)
$$C = 90^{\circ}$$
; (ii.) $A - B = 90^{\circ}$, and $B = C$.

§ 36. The Solution of an Oblique Triangle.

The formulas established in §§ 33-35, together with the equation $A+B+C=180^{\circ}$, are sufficient for solving every case of an oblique triangle. The three parts that determine an oblique triangle may be:

- I. One side and two angles;
- II. Two sides and the angle opposite to one of these sides;
- III. Two sides and the included angle;
- IV. The three sides.

Let A, B, C denote the angles, a, b, c the sides respectively.

Given one side a, and two angles A and B; find the remaining parts C, b, and c.

1.
$$C = 180^{\circ} - (A + B)$$
.

1.
$$C = 180 - (A + B)$$
.
2. $\frac{b}{a} = \frac{\sin B}{\sin A}$; $\therefore b = \frac{a \sin B}{\sin A} = \frac{a}{\sin A} \times \sin B$.
3. $\frac{c}{a} = \frac{\sin C}{\sin A}$; $\therefore c = \frac{a \sin C}{\sin A} = \frac{a}{\sin A} \times \sin C$.

3.
$$\frac{c}{a} = \frac{\sin C}{\sin A}$$
; $\therefore c = \frac{a \sin C}{\sin A} = \frac{a}{\sin A} \times \sin C$

Example. a = 24.31, $A = 45^{\circ} 18'$, $B = 22^{\circ} 11'$.

The work may be arranged as follows:

Note. When -10 is omitted after a logarithm or cologarithm, it must be remembered that the log or colog is 10 too large.

EXERCISE XVII.

- $A = 10^{\circ} 12'$, $B = 46^{\circ} 36'$; 1. Given a = 500, find $C = 123^{\circ} 12'$, b = 2051.48, c = 2362.61. 2. Given a = 795, $A = 79^{\circ} 59', B = 44^{\circ} 41';$ find $C = 55^{\circ} 20'$, b = 567.688, c = 663.986. $A = 99^{\circ} 55', B = 45^{\circ} 1';$ 3. Given a = 804, find $C = 35^{\circ} 4'$ b = 577.313, c = 468.933. $A = 12^{\circ} 49'$, $B = 141^{\circ} 59'$; 4. Given a = 820, find $C = 25^{\circ} 12'$, b = 2276.63, c = 1573.89.5. Given c = 1005, $A = 78^{\circ} 19', B = 54^{\circ} 27';$ find $C = 47^{\circ} 14'$, a = 1340.6, b = 1113.8. $B = 13^{\circ} 57'$ $C = 57^{\circ} \, 13';$ 6. Given b = 13.57, find $A = 108^{\circ} 50'$, a = 53.276, c = 47.324. $A = 70^{\circ} 55'$ $C = 52^{\circ} 9'$; 7. Given a = 6412, find $B = 56^{\circ} 56'$, b = 5685.9c = 5357.5. 8. Given b = 999, $A = 37^{\circ} 58'$ $C = 65^{\circ} 2'$; find $B = 77^{\circ}$, a = 630.77, c = 929.48.
- 9. In order to determine the distance of a hostile fort A from a place B, a line BC and the angles ABC and BCA were measured, and found to be 322.55 yards, 60° 34′, and 56° 10′, respectively. Find the distance AB.
- 10. In making a survey by triangulation, the angles B and C of a triangle ABC were found to be 50° 30′ and 122° 9′, respectively, and the length BC is known to be 9 miles. Find AB and AC.
- 11. Two observers 5 miles apart on a plain, and facing each other, find that the angles of elevation of a balloon in the same vertical plane with themselves are 55° and 58°, respectively. Find the distance from the balloon to each observer, and also the height of the balloon above the plain.
- 12. In a parallelogram given a diagonal d and the angles x and y which this diagonal makes with the sides. Find the sides. Find the sides if d = 11.237, $x = 19^{\circ}$ 1', and $y = 42^{\circ}$ 54'.

13. A lighthouse was observed from a ship to bear N. 34° E.; after sailing due south 3 miles, it bore N. 23° E. Find the distance from the lighthouse to the ship in both positions.

Note. The phrase to bear $N.34^{\circ}$ E. means that the line of sight to the lighthouse is in the north-east quarter of the horizon, and makes, with a line due north, an angle of 34° .

14. In a trapezoid given the parallel sides a and b, and the angles x and y at the ends of one of the parallel sides. Find the non-parallel sides. Compute the results when a=15, b=7, $x=70^{\circ}$, $y=40^{\circ}$.

Solve the following examples without using logarithms:

- 15. Given b = 7.07107, $A = 30^{\circ}$, $C = 105^{\circ}$; find a and c.
- 16. Given c = 9.562, $A = 45^{\circ}$, $B = 60^{\circ}$; find a and b.
- 17. The base of a triangle is 600 feet, and the angles at the base are 30° and 120°. Find the other sides and the altitude.
- 18. Two angles of a triangle are, the one 20°, the other 40°. Find the ratio of the opposite sides.
- 19. The angles of a triangle are as 5:10:21, and the side opposite the smallest angle is 3. Find the other sides.
- 20. Given one side of a triangle equal to 27, the adjacent angles equal each to 30°. Find the radius of the circumscribed circle. (See § 33, Note.)

Given two sides a and b, and the angle A opposite to the side a; find the remaining parts B, C, c.

This case, like the preceding case, is solved by means of the Law of Sines.

Since
$$\frac{\sin B}{\sin A} = \frac{b}{a}$$
, therefore $\sin B = \frac{b \sin A}{a}$; $C = 180^{\circ} - (A + B)$.

And since $\frac{c}{a} = \frac{\sin C}{\sin A}$, therefore $c = \frac{a \sin C}{\sin A}$.

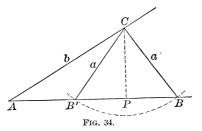

When an angle is determined by its sine it admits of two values, which are supplements of each other (\S 24); hence, either value of B may be taken unless excluded by the conditions of the problem.

If a > b, then by Geometry A > B, and B must be acute whatever be the value of A; for a triangle can have only one obtuse angle. Hence, there is one, and only one, triangle that will satisfy the given conditions.

If a = b, then by Geometry A = B; both A and B must be acute, and the required triangle is isosceles.

If a < b, then by Geometry A < B, and A must be acute

in order that the triangle may be possible. If A is acute, it is evident from Fig. 34, where $\angle BAC = A$, AC = b, CB = CB' = a, that the two triangles ACB and ACB' will satisfy the given conditions, provided a is greater than the per-

pendicular CP; that is, provided a is greater than $b \sin A$ (§ 11). The angles ABC and AB'C are supplementary (since $\angle ABC = \angle BB'C$); they are in fact the supplementary angles obtained from the formula

$$\sin B = \frac{b \sin A}{a}$$

If, however, $a = b \sin A = CP$ (Fig. 34), then $\sin B = 1$, $B = 90^{\circ}$, and the triangle required is a right triangle.

If $a < b \sin A$, that is, < CP, then $\sin B > 1$, and the triangle is impossible.

These results, for convenience, may be thus stated:

Two solutions; if A is acute and the value of a lies between b and $b \sin A$.

No solution; if A is acute and $a < b \sin A$; or if A is obtuse and a < b.

One solution; in all other cases.

The number of solutions can often be determined by inspection. In case of doubt, find the value of $b \sin A$.

Or we may proceed to compute $\log \sin B$. If $\log \sin B = 0$, the triangle required is a right triangle. If $\log \sin B > 0$, the triangle is impossible. If $\log \sin B < 0$, there is *one* solution when a > b; there are *two* solutions when a < b.

When there are two solutions, let B', C', c', denote the unknown parts of the second triangle; then,

$$B' = 180^{\circ} - B$$
, $C' = 180^{\circ} - (A + B') = B - A$,
 $e' = \frac{a \sin C'}{\sin A}$.

EXAMPLES.

1. Given a = 16, b = 20, $A = 106^{\circ}$; find the remaining parts.

In this case a < b, and $A > 90^{\circ}$; therefore the triangle is impossible.

2. Given a = 36, b = 80, $A = 30^{\circ}$; find the remaining parts.

Here we have $b \sin A = 80 \times \frac{1}{2} = 40$; so that $a < b \sin A$, and the triangle is impossible.

3. Given a = 72630, b = 117480, $A = 80^{\circ}0'50''$; find B, C, c.

4. Given a = 13.2, b = 15.7, $A = 57^{\circ} 13' 15''$; find B, C, c.

```
a = 13.2
                                 \operatorname{colog} a = 8.87943
                                                                              c=b\cos A
                                                                         \log b = 1.19590
                                    \log b = 1.19590
    b = 15.7
                                                                  \log\cos A = 9.73352
   A = 57^{\circ}13'15''
                              \log \sin A = 9.92467
                              \log \sin B = \overline{0.00000}
                                                                        \log c = 0.92942
Here \log \sin B = 0,
\therefore a right triangle.
                                       B = 90^{\circ}
                                                                              c = 8.5
                                     \therefore C = 32^{\rm o}46^{\prime}45^{\prime\prime}
```

5. Given a = 767, b = 242, $A = 36^{\circ} 53' 2''$; find B, C, c.

```
\log a = 2.88480
a = 767
                                colog a = 7.11520
                                                                     \log \sin \mathit{C} = 9.86970
                                   \log b = 2.38382
 b = 242
                             \log \sin A = 9.77830
                                                                  \operatorname{colog}\sin A = 0.22170
A = 36^{\circ} \, 53' \, 2''
                             \log \sin B = \overline{9.27732}
                                                                          \log c = \overline{2.97620}
Here a > b,
and \log \sin B < 0.
                                      B = 10^{\circ} \, 54' \, 58''
                                                                               c = 946.675
                                    \therefore C = 132^{\circ} 12' 0''
\therefore one solution.
```

6. Given a = 177.01, b = 216.45, $A = 35^{\circ} 36' 20''$; find the other parts.

oundr pares.

	or 9° 47′ 8″		

EXERCISE XVIII.

1. Determine the number of solutions in each of the following cases:

- 2. Given a = 840, b = 485, $A = 21^{\circ} 31'$; find $B = 12^{\circ} 13' 34''$, $C = 146^{\circ} 15' 26''$, c = 1272.18.
- 3. Given a = 9.399, b = 9.197, $A = 120^{\circ} 35'$; find $B = 57^{\circ} 23' 40''$, $C = 2^{\circ} 1' 20''$, c = 0.38525.
- 4. Given a = 91.06, b = 77.04, $A = 51^{\circ} 9' 6''$; find $B = 41^{\circ} 13'$, $C = 87^{\circ} 37' 54''$, c = 116.82.
- 5. Given a = 55.55, b = 66.66, $B = 77^{\circ} 44' 40''$; find $A = 54^{\circ} 31' 13''$, $C = 47^{\circ} 44' 7''$, c = 50.481.
- 6. Given a = 309, b = 360, $A = 21^{\circ} 14' 25''$; find $B = 24^{\circ} 57' 54''$, $C = 133^{\circ} 47' 41''$, c = 615.67, $B' = 155^{\circ} 2' 6''$, $C' = 3^{\circ} 43' 29''$, c' = 55.41.
- 7. Given a = 8.716, b = 9.787, $A = 38^{\circ} 14' 12''$; find $B = 44^{\circ} 1' 28''$, $C = 97^{\circ} 44' 20''$, c = 13.954, $B' = 135^{\circ} 58'32''$, $C' = 5^{\circ} 47' 16''$, c' = 1.4203.
- 8. Given a = 4.4, b = 5.21, $A = 57^{\circ} 37' 17''$; find $B = 90^{\circ}$, $C = 32^{\circ} 22' 43''$, c = 2.79.
- 9. Given a=34, b=22, $B=30^{\circ} 20'$; find $A=51^{\circ} 18' 27''$, $C=98^{\circ} 21' 33''$, c=43.098, $A'=128^{\circ} 41' 33''$, $C'=20^{\circ} 58' 27''$, c'=15.593.
- 10. Given b = 19, c = 18, $C = 15^{\circ} 49'$; find $B = 16^{\circ} 43' 13''$, $A = 147^{\circ} 27' 47''$, a = 35.519, $B' = 163^{\circ} 16' 47''$, $A' = 0^{\circ} 54' 13''$, a' = 1.0415.
- 11. Given a=75, b=29, $B=16^{\circ}15'36''$; find the difference between the areas of the two corresponding triangles without finding their areas separately.
- 12. Given in a parallelogram the side a, a diagonal d, and the angle A made by the two diagonals; find the other diagonal. Special case: a=35, d=63, $A=21^{\circ}$ 36' 30".

§ 39. Case III.

Given two sides a and b and the included angle C; find the remaining parts, A, B, and c.

Solution I. The angles A and B may both be found by means of Formula [27], § 35, which may be written

$$\tan \frac{1}{2}(A-B) = \frac{a-b}{a+b} \times \tan \frac{1}{2}(A+B).$$

Since $\frac{1}{2}(A+B) = \frac{1}{2}(180^{\circ} - C)$, the value of $\frac{1}{2}(A+B)$ is known; so that this equation enables us to find the value of $\frac{1}{2}(A-B)$. We then have

$$\frac{1}{2}(A+B) + \frac{1}{2}(A-B) = A,$$

$$\frac{1}{2}(A+B) - \frac{1}{2}(A-B) = B.$$

and

After A and B are known, the side c may be found by the Law of Sines, which gives its value in two ways, as follows:

$$c = \frac{a \sin C}{\sin A}$$
, or $c = \frac{b \sin C}{\sin B}$.

Solution II. The third side c may be found directly from the equation (§ 34)

$$c = \sqrt{a^2 + b^2 - 2ab\cos C};$$

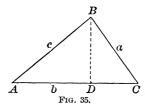

and then, by the Law of Sines, the following equations for computing the values of the angles A and B are obtained:

$$\sin A = a \times \frac{\sin C}{c}, \quad \sin B = b \times \frac{\sin C}{c}$$

Solution III. If, in the triangle ABC (Fig. 35), BD is drawn perpendicular to the side AC, then

$$\tan A = \frac{BD}{AD} = \frac{BD}{AC - DC}.$$
Now $BD = a \sin C$ (§ 10), and $DC = a \cos C.$

$$\therefore \tan A = \frac{a \sin C}{b - a \cos C}.$$

By merely changing the letters,

$$\tan B = \frac{b \sin C}{a - b \cos C}.$$

It is not necessary, however, to use both formulas. When one angle, as A, has been found, the other, B, may be found from the relation $A + B + C = 180^{\circ}$.

When the angles are known, the third side is found by the Law of Sines, as in Solution I.

Note. When all three unknown parts are required, Solution I. is the most convenient in practice. When only the third side c is desired, Solution II. may be used to advantage, provided the values of a^2 and b^2 can be readily obtained without the aid of logarithms. But Solutions II. and III. are not adapted to logarithmic work.

EXAMPLES.

1. Given a = 748, b = 375, $C = 63^{\circ} 35' 30''$; find A, B, and c.

Note. In the above Example we use the angle B in finding the side c, rather than the angle A, because A is near 90° , and therefore its sine should be avoided.

2. Given a=4, c=6, $B=60^{\circ}$; find the third side b.

Here Solution II. may be used to advantage. We have

$$b\sqrt{a^2+c^2-2} \, ac \cos B = \sqrt{16+36-24} = \sqrt{28};$$

 $\log 28 = 1.44716, \quad \log \sqrt{28} = 0.72358, \quad \sqrt{28} = 5.2915;$

that is, b = 5.2915.

 $C = 72^{\circ}15';$

EXERCISE XIX.

b = 83.39,

- 1. Given a = 77.99, $B = 56^{\circ} 30'$ c = 95.24.find $A = 51^{\circ} 15'$, $A = 80^{\circ};$ 2. Given b = 872.5, c = 632.7 $C = 39^{\circ} 15'$ find $B = 60^{\circ} 45'$ a = 984.83.3. Given a = 17, b = 12, $C = 59^{\circ} 17';$ find $A = 77^{\circ} 12' 53''$, $B = 43^{\circ} 30' 7''$ c = 14.987.
- $c=\sqrt{3}$ $A = 35^{\circ} 53';$ 4. Given $b = \sqrt{5}$, find $B = 93^{\circ} 28' 36''$, $C = 50^{\circ} 38' 24''$, a = 1.313.
- $C = 33^{\circ} 7' 9'';$ 5. Given a = 0.917, b = 0.312find $A = 132^{\circ} 18' 27''$, $B = 14^{\circ} 34' 24''$, c = 0.67748.
- c = 11.214, $B = 15^{\circ} 22' 36'';$ 6. Given a = 13.715, find $A = 118^{\circ} 55' 49''$, $C = 45^{\circ} 41' 35''$, b = 4.1554.
- $A = 86^{\circ} 4' 4'';$ 7. Given b = 3000.9, c = 1587.2 $C = 28^{\circ} 42' 5''$ find $B = 65^{\circ} 13' 51''$, a = 3297.2.
- 8. Given a = 4527, b = 3465, $C = 66^{\circ} 6' 27'';$ find $A = 68^{\circ} 29' 15''$, $B = 45^{\circ} 24' 18'', c = 4449.$
- $C = 30^{\circ} 24';$ b = 33.09, 9. Given a = 55.14, find $A = 117^{\circ} 24' 33''$, $B = 32^{\circ} 11' 27''$, c = 31.431.
- $C = 175^{\circ} 19' 10'';$ 10. Given a = 47.99, b = 33.14, $B = 1^{\circ} 54' 42'', c = 81.066.$ find $A = 2^{\circ} 46' 8''$,
- 11. If two sides of a triangle are each equal to 6, and the included angle is 60°, find the third side.
- 12. If two sides of a triangle are each equal to 6, and the included angle is 120°, find the third side.
- 13. Apply Solution I. to the case in which α is equal to b; that is, the case in which the triangle is isosceles.
- 14. If two sides of a triangle are 10 and 11, and the included angle is 50°, find the third side.
- 15. If two sides of a triangle are 43.301 and 25, and the included angle is 30°, find the third side.
- 16. In order to find the distance between two objects A and B separated by a swamp, a station C was chosen, and the

distances CA = 3825 yards, CB = 3475.6 yards, together with the angle $ACB = 62^{\circ}$ 31', were measured. Find the distance from A to B.

17. Two inaccessible objects A and B are each viewed from two stations C and D on the same side of AB and 562 yards apart. The angle ACB is 62° 12', BCD 41° 8', ADB 60° 49', and ADC 34° 51'; required the distance AB.

18. Two trains start at the same time from the same station, and move along straight tracks that form an angle of 30°, one train at the rate of 30 miles an hour, the other at the rate of 40 miles an hour. How far apart are the trains at the end of half an hour?

19. In a parallelogram given the two diagonals 5 and 6, and the angle that they form 49° 18′. Find the sides.

20. In a triangle one angle $= 139^{\circ} 54'$, and the sides forming the angle have the ratio 5:9. Find the other two angles.

Given the three sides a, b, c; find the angles A, B, C.

The angles may be found directly from the formulas established in § 34. Thus, from the formula

$$a^{2} = b^{2} + c^{2} - 2bc \cos A$$
$$\cos A = \frac{b^{2} + c^{2} - a^{2}}{2bc}.$$

we have

From this equation formulas adapted to logarithmic work are deduced as follows:

For the sake of brevity, let a+b+c=2s; then b+c-a=2(s-a), a-b+c=2(s-b), and a+b-c=2(s-c). Then the value of $1-\cos A$ is

$$1 - \frac{b^{2} + c^{2} - a^{2}}{2bc} = \frac{2bc - b^{2} - c^{2} + a^{2}}{2bc} = \frac{a^{2} - (b - c)^{2}}{2bc}$$
$$= \frac{(a + b - c)(a - b + c)}{2bc} = \frac{2(s - b)(s - c)}{bc};$$

and the value of $1 + \cos A$ is

$$1 + \frac{b^2 + c^2 - a^2}{2bc} = \frac{2bc + b^2 + c^2 - a^2}{2bc} = \frac{(b+c)^2 - a^2}{2bc}$$
$$= \frac{(b+c+a)(b+c-a)}{2bc} = \frac{2s(s-a)}{bc}.$$

But from Formulas [16] and [17], § 30, it follows that $1 - \cos A = 2\sin^2 \frac{1}{2}A$, and $1 + \cos A = 2\cos^2 \frac{1}{2}A$.

$$\therefore 2\sin^2\frac{1}{2}A = \frac{2(s-b)(s-c)}{bc}, \text{ and } 2\cos^2\frac{1}{2}A = \frac{2s(s-a)}{bc},$$
 whence
$$\sin\frac{1}{2}\mathbf{A} = \sqrt{\frac{(\mathbf{s}-\mathbf{b})(\mathbf{s}-\mathbf{c})}{bc}},$$

$$\sin\frac{1}{2}\mathbf{A} = \sqrt{\frac{(\mathbf{s} - \mathbf{b})(\mathbf{s} - \mathbf{c})}{\mathbf{b}\mathbf{c}}},$$
 [28]

$$\cos \frac{1}{2} \mathbf{A} = \sqrt{\frac{\mathbf{s} (\mathbf{s} - \mathbf{a})}{\mathbf{b} \mathbf{c}}}, \qquad [29]$$

and by [2]
$$\tan \frac{1}{2} \mathbf{A} = \sqrt{\frac{(\mathbf{s} - \mathbf{b}) (\mathbf{s} - \mathbf{c})}{\mathbf{s} (\mathbf{s} - \mathbf{a})}}$$
 [30]

By merely changing the letters

$$\sin \frac{1}{2} B = \sqrt{\frac{(s-a)(s-c)}{ac}}, \ \sin \frac{1}{2} C = \sqrt{\frac{(s-a)(s-b)}{ab}}.$$

$$\cos \frac{1}{2} B = \sqrt{\frac{s(s-b)}{ac}}, \ \cos \frac{1}{2} C = \sqrt{\frac{s(s-c)}{ab}}.$$

$$\tan \frac{1}{2} B = \sqrt{\frac{(s-a)(s-c)}{s(s-b)}}, \ \tan \frac{1}{2} C = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}}.$$

There is then a choice of three different formulas for finding the value of each angle. If half the angle is very near 0°, the formula for the cosine will not give a very accurate result, because the cosines of angles near 0° differ little in value; and the same holds true of the formula for the sine when half the angle is very near 90°. Hence, in the first case the formula for the sine, in the second that for the cosine, should be used.

But, in general, the formulas for the tangent are to be preferred.

It is not necessary to compute by the formulas more than two angles; for the third may then be found from the equation

$$A + B + C = 180^{\circ}$$
.

There is this advantage, however, in computing all three angles by the formulas, that we may then use the sum of the angles as a test of the accuracy of the results.

In case it is desired to compute all the angles, the formulas for the tangent may be put in a more convenient form.

The value of $\tan \frac{1}{2}A$ may be written

$$\sqrt{\frac{(s-a)\,(s-b)\,(s-c)}{s\,(s-a)^2}} \text{ or } \frac{1}{s-a}\sqrt{\frac{(s-a)\,(s-b)\,(s-c)}{s}}.$$

Hence, if we put

$$\sqrt{\frac{(\mathbf{s}-\mathbf{a})\ (\mathbf{s}-\mathbf{b})\ (\mathbf{s}-\mathbf{c})}{\mathbf{s}}} = \mathbf{r},$$
 [31]

we have

$$\tan \frac{1}{2} \mathbf{A} = \frac{\mathbf{r}}{\mathbf{s} - \mathbf{a}}.$$
 [32]

Likewise,

$$\tan \frac{1}{2}B = \frac{r}{s-b}, \quad \tan \frac{1}{2}C = \frac{r}{s-c}.$$

EXAMPLES.

1. Given a = 3.41, b = 2.60, c = 1.58; find the angles.

Using Formula [30], and the corresponding formula for $\tan \frac{1}{2}B$, we may arrange the work as follows:

2. Solve Example 1 by finding all three angles by the use of Formulas [31] and [32].

Here the work may be compactly arranged as follows, if we find $\log\tan\frac{1}{2}A$, etc., by subtracting $\log{(s-a)}$, etc., from \log{r} instead of adding the cologarithm:

a = 3.41	$\log(s-a) = 9.58546$	$\log \tan \frac{1}{2}A = 1$	10.12903
b = 2.60	$\log (s - b) = 0.07737$	$\log \tan \frac{1}{2} B =$	9.63713
c = 1.58	$\log (s - c) = 0.34537$	$\log \tan \frac{1}{2} C =$	9.36912
$2s = \overline{7.59}$	$\operatorname{colog} s = 9.42079$	$\frac{1}{2}A =$	53° 23′ 20″
$s = \overline{3.795}$	$\log r^2 = \overline{9.42899}$	$\frac{1}{2}B =$	$23^{\rm o}26^{\prime}37^{\prime\prime}$
s - a = 0.385	$\log r = 9.71450$	$\frac{1}{2}C =$	13° 10′ 3″
s - b = 1.195		$A = \hat{A}$	106° 46′ 40′′
s - c = 2.215		B =	$46^{\circ}53^{\prime}14^{\prime\prime}$
$2s = \overline{7.590}$ (1	proof).	C =	26° 20′ 6′′
,,	Proc	of. $A + B + C = 1$	180° 0′ 0″

Note. Even if no mistakes are made in the work, the sum of the three angles found as above may differ very slightly from 180° in consequence of the fact that logarithmic computation is at best only a method of close approximation. When a difference of this kind exists it should be divided among the angles according to the probable amount of error for each angle.

EXERCISE XX.

Solve the following triangles, taking the three sides as the given parts:

	a	b	c	A	В	C
					-	
1	51	65	20	38° 52′ 48″	126° 52′ 12″	14° 15′
2	78	101	29	32° 10′ 54″	136° 23′ 50″	11° 25′ 16′′
3	111	145	40	27° 20′ 32′′	143° 7′48″	9° 31′ 40″
4	21	26	31	42° 6′ 13′′	56° 6′ 36″	81° 47′ 11″
5	19	34	49	16° 25′ 36′′	30° 24′	133° 10′ 24′′
6	43	50	57	46° 49′ 35″	57° 59′ 44′′	75° 10′ 41″
7	37	58	79	26° 0′ 29′′	43° 25′ 20′′	110° 34′ 11″
8	73	82	91	49° 34′ 58″	58° 46′ 58′′~	71° 38′ 4″
9	14.493	55.4363	66.9129	8° 20′	33° 40′	138°
10	$\sqrt{5}$	$\sqrt{6}$	$\sqrt{7}$	51° 53′ 12″	59° 31′ 48″	68° 35′
1	(

11. Given a=6, b=8, c=10; find the angles.

12. Given a=6, b=6, c=10; find the angles.

13. Given a=6, b=6, c=6; find the angles.

14. Given a = 6, b = 5, c = 12; find the angles.

15. Given a=2, $b=\sqrt{6}$, $c=\sqrt{3}-1$; find the angles.

16. Given a = 2, $b = \sqrt{6}$, $c = \sqrt{3} + 1$; find the angles.

17. The distances between three cities A, B, and C are as follows: AB = 165 miles, AC = 72 miles, and BC = 185 miles. B is due east from A. In what direction is C from A? What two answers are admissible?

18. Under what visual angle is an object 7 feet long seen by an observer whose eye is 5 feet from one end of the object and 8 feet from the other end?

19. When Formula [28] is used for finding the value of an angle, why does the ambiguity that occurs in Case II. not exist?

20. If the sides of a triangle are 3, 4, and 6, find the sine of the largest angle.

21. Of three towns A, B, and C, A is 200 miles from B and 184 miles from C, B is 150 miles due north from C; how far is A north of C?

§ 41. Area of a Triangle.

Case I. When two sides and the included angle are given:

In the triangle ABC (Fig. 31 or 32), the area

$$F = \frac{1}{2} c \times CD$$
.

By § 11,

$$CD = a \sin B$$
.

Therefore,

$$\mathbf{F} = \frac{1}{2} \operatorname{ac} \sin \mathbf{B}$$
.

Also,

$$F = \frac{1}{2} ab \sin C$$
 and $F = \frac{1}{2} bc \sin A$.

Case II. When a side and the two adjacent angles are given:

By § 33,

$$\sin A : \sin C :: a : c$$
.

Therefore,

$$c = \frac{a \sin C}{\sin A}$$

Putting this value of c in Formula [33], we have

$$\mathbf{F} = \frac{\mathbf{a}^2 \sin \mathbf{B} \sin \mathbf{C}}{2 \sin (\mathbf{B} + \mathbf{C})}.$$
 [34]

CASE III. When the three sides of a triangle are given:

By § 29, $\sin B = 2 \sin \frac{1}{2} B \times \cos \frac{1}{2} B$.

By substituting for $\sin \frac{1}{2} B$ and $\cos \frac{1}{2} B$ their values in terms of the sides given in § 40,

$$\sin B = \frac{2}{ac} \sqrt{s(s-a)(s-b)(s-c)}.$$

By putting this value of $\sin B$ in [33], we have

$$\mathbf{F} = \sqrt{\mathbf{s} (\mathbf{s} - \mathbf{a}) (\mathbf{s} - \mathbf{b}) (\mathbf{s} - \mathbf{c})}.$$
 [35]

CASE IV. When the three sides and the radius of the circumscribed circle, or the radius of the inscribed circle, are given:

If R denote the radius of the circumscribed circle, we have, from $\S 33$,

$$\sin B = \frac{b}{2R}$$

By putting this value of $\sin B$ in [33], we have

$$\mathbf{F} = \frac{\mathbf{abc}}{\mathbf{4} \, \mathbf{R}}.$$

If r denote the radius of the inscribed circle,

divide the triangle into three triangles by lines from the centre of this circle to the vertices; then the altitude of each of the three triangles is equal to r. Therefore,

$$\mathbf{F} = \frac{1}{2} \mathbf{r} (\mathbf{a} + \mathbf{b} + \mathbf{c}) = \mathbf{rs}.$$
 [37]

By putting in this formula the value of F given in [35],

$$r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}};$$

whence r, in [31] § 40, is equal to the radius of the inscribed circle.

EXERCISE XXI.

Find the area:

- 1. Given a = 4474.5, b = 2164.5, $C = 116^{\circ} 30' 20''$.
- 2. Given b = 21.66, c = 36.94, $A = 66^{\circ} 4' 19''$.
- 3. Given a = 510, c = 173, $B = 162^{\circ} 30' 28''$.
- 4. Given a = 408, b = 41, c = 401.
- 5. Given a = 40, b = 13, c = 37.
- 6. Given a = 624, b = 205, c = 445.
- 7. Given b = 149, $A = 70^{\circ} 42' 30''$, $B = 39^{\circ} 18' 28''$.
- 8. Given a = 215.9, c = 307.7, $A = 25^{\circ} 9' 31''$.
- 9. Given b=8, c=5, $A=60^{\circ}$.
- 10. Given a = 7, c = 3, $A = 60^{\circ}$.
- 11. Given $a=60,\ B=40^{\circ}$ 35′ 12″, area = 12; find the radius of the inscribed circle.
- 12. Obtain a formula for the area of a parallelogram in terms of two adjacent sides and the included anglé.
- 13. Obtain a formula for the area of an isosceles trapezoid in terms of the two parallel sides and an acute angle.
- 14. Two sides and included angle of a triangle are 2416, 1712, and 30°; and two sides and included angle of another triangle are 1948, 2848, and 150°; find the sum of their areas.
- 15. The base of an isosceles triangle is 20, and its area is $100 \div \sqrt{3}$; find its angles.
- 16. Show that the area of a quadrilateral is equal to one half the product of its diagonals into the sine of their included angle.

EXERCISE XXII.

1. From a ship sailing down the English Channel the Eddystone was observed to bear N. 33° 45′ W.; and after the ship had sailed 18 miles S. 67° 30′ W. it bore N. 11° 15′ E. Find its distance from each position of the ship.

- 2. Two objects, A and B, were observed from a ship to be at the same instant in a line bearing N. 15° E. The ship then sailed north-west 5 miles, when it was found that A bore due east and B bore north-east. Find the distance from A to B.
- 3. A castle and a monument stand on the same horizontal plane. The angles of depression of the top and the bottom of the monument viewed from the top of the castle are 40° and 80°; the height of the castle is 140 feet. Find the height of the monument.
- 4. If the sun's altitude is 60°, what angle must a stick make with the horizon in order that its shadow in a horizontal plane may be the longest possible?
- 5. If the sun's altitude is 30°, find the length of the longest shadow cast on a horizontal plane by a stick 10 feet in length.
- 6. In a circle with the radius 3 find the area of the part comprised between parallel chords whose lengths are 4 and 5. (Two solutions.)
- 7. A and B, two inaccessible objects in the same horizontal plane, are observed from a balloon at C, and from a point D directly under the balloon and in the same horizontal plane with A and B. If CD = 2000 yards, $\angle ACD = 10^{\circ} 15' 10''$, $\angle BCD = 6^{\circ} 7' 20''$, $\angle ADB = 49^{\circ} 34' 50''$, find AB.
- 8. A and B are two objects whose distance, on account of intervening obstacles, cannot be directly measured. At the summit C of a hill, whose height above the common horizontal plane of the objects is known to be 517.3 yards, $\angle ACB$ is found to be 15° 13′ 15″. The angles of elevation of C viewed from A and B are 21° 9′ 18″ and 23° 15′ 34″ respectively. Find the distance from A to B.

CHAPTER V.

MISCELLANEOUS EXAMPLES.

PROBLEMS IN PLANE TRIGONOMETRY.

1. The angular distance of any object from a horizontal plane, as observed at any point of that plane, is the angle which a line drawn from the object to the point of observation makes with the plane. If the object observed be situated above the horizontal plane (that is, if it is farther from the earth's centre than the plane is), its angular distance from the plane is called its angle of elevation. If the object be below the plane, its angular distance from the plane is called its angle of depression. These angles are evidently vertical angles.

If two objects are in the same horizontal plane with the point of observation, the angular distance of one object from the other is called its *bearing* from that object.

If two objects are not in the same horizontal plane with either each other or the point of observation, we may suppose vertical lines to be passed through the two objects, and to meet the horizontal plane of the point of observation in two points. The angular distance of these two points is the bearing of either of the objects from the other. It may also be called the *horizontal distance* of one object from the other.

Note. "Problems in Plane Trigonometry" are selected from those published by Mr. Charles W. Sever, Cambridge, Mass. The full set can be obtained from him in pamphlet form.

RIGHT TRIANGLES.

- 2. The angle of elevation of a tower is 48° 19′ 14″, and the distance of its base from the point of observation is 95 ft. Find the height of the tower, and the distance of its top from the point of observation.
- 3. From a mountain 1000 ft. high, the angle of depression of a ship is 77° 35' 11". Find the distance of the ship from the summit of the mountain.
- 4. A flag-staff 90 ft. high, on a horizontal plane, casts a shadow of 117 ft. Find the altitude of the sun.
- 5. When the moon is setting at any place, the angle at the moon subtended by the earth's radius passing through that place is 57'3". If the earth's radius is 3956.2 miles, what is the moon's distance from the earth's centre?
- 6. The angle at the earth's centre subtended by the sun's radius is 16'2", and the sun's distance is 92,400,000 miles. Find the sun's diameter in miles.
- 7. The latitude of Cambridge, Mass., is 42° 22′ 49″. What is the length of the radius of that parallel of latitude?
- 8. At what latitude is the circumference of the parallel of latitude half of that of the equator?
- 9. In a circle with a radius of 6.7 is inscribed a regular polygon of thirteen sides. Find the length of one of its sides.
- 10. A regular heptagon, one side of which is 5.73, is inscribed in a circle. Find the radius of the circle.
- 11. A tower 93.97 ft. high is situated on the bank of a river. The angle of depression of an object on the opposite bank is 25° 12′54″. Find the breadth of the river.

- 12. From a tower 58 ft. high the angles of depression of two objects situated in the same horizontal line with the base of the tower, and on the same side, are 30° 13' 18'' and 45° 46' 14''. Find the distance between these two objects.
- 13. Standing directly in front of one corner of a flat-roofed house, which is 150 ft. in length, I observe that the horizontal angle which the length subtends has for its cosine $\sqrt{\frac{1}{5}}$, and that the vertical angle subtended by its height has for its sine
- $\frac{3}{\sqrt{34}}$. What is the height of the house?
- 14. A regular pyramid, with a square base, has a lateral edge 150 ft. in length, and the length of a side of its base is 200 ft. Find the inclination of the face of the pyramid to the base.
- 15. From one edge of a ditch 36 ft. wide, the angle of elevation of a wall on the opposite edge is 62° 39′ 10″. Find the length of a ladder which will reach from the point of observation to the top of the wall.
- 16. The top of a flag-staff has been broken off, and touches the ground at a distance of 15 ft. from the foot of the staff. The length of the broken part being 39 ft., find the whole length of the staff.
- 17. From a balloon, which is directly above one town, is observed the angle of depression of another town, 10° 14′ 9″. The towns being 8 miles apart, find the height of the balloon.
- 18. From the top of a mountain 3 miles high the angle of depression of the most distant object which is visible on the earth's surface is found to be 2° 13′ 50″. Find the diameter of the earth.
- 19. A ladder 40 ft. long reaches a window 33 ft. high, on one side of a street. Being turned over upon its foot, it reaches another window 21 ft. high, on the opposite side of the street. Find the width of the street.

- 20. The height of a house subtends a right angle at a window on the other side of the street; and the elevation of the top of the house, from the same point, is 60°. The street is 30 ft. wide. How high is the house?
- 21. A lighthouse 54 ft. high is situated on a rock. The elevation of the top of the lighthouse, as observed from a ship, is 4° 52', and the elevation of the top of the rock is 4° 2'. Find the height of the rock, and its distance from the ship.
- 22. A man in a balloon observes the angle of depression of an object on the ground, bearing south, to be 35° 30'; the balloon drifts $2\frac{1}{2}$ miles east at the same height, when the angle of depression of the same object is 23° 14'. Find the height of the balloon.
- 23. A man standing south of a tower, on the same horizontal plane, observes its elevation to be 54° 16'; he goes east 100 yds., and then finds its elevation is 50° 8'. Find the height of the tower.
- 24. The elevation of a tower at a place A south of it is 30° ; and at a place B, west of A, and at a distance of α from it, the elevation is 18° . Show that the height of the tower is

$$\frac{a}{\sqrt{(2+2\sqrt{5})}}$$
; the tangent of 18° being $\frac{\sqrt{5}-1}{\sqrt{(10+2\sqrt{5})}}$.

- 25. A pole is fixed on the top of a mound, and the angles of elevation of the top and the bottom of the pole are 60° and 30° respectively. Prove that the length of the pole is twice the height of the mound.
- 26. At a distance (a) from the foot of a tower, the angle of elevation (A) of the top of the tower is the complement of the angle of elevation of a flag-staff on top of it. Show that the length of the staff is $2a \cot 2A$.
- 27. A line of true level is a line every point of which is equally distant from the centre of the earth. A line drawn

tangent to a line of true level at any point is a line of apparent level. If at any point both these lines are drawn, and extended one mile, find the distance they are then apart.

28. In Problem 2, determine the effect upon the computed height of the tower, of an error in either the angle of elevation or the measured distance.

OBLIQUE TRIANGLES.

- 29. To determine the height of an inaccessible object situated on a horizontal plane, by observing its angles of elevation at two points in the same line with its base, and measuring the distance of these two points.
- 30. The angle of elevation of an inaccessible tower, situated on a horizontal plane, is 63° 26′; at a point 500 ft. farther from the base of the tower the elevation of its top is 32° 14′. Find the height of the tower.
- 31. A tower is situated on the bank of a river. From the opposite bank the angle of elevation of the tower is 60° 13′, and from a point 40 ft. more distant the elevation is 50° 19′. Find the breadth of the river.
- 32. A ship sailing north sees two lighthouses 8 miles apart, in a line due west; after an hour's sailing, one lighthouse bears S.W., and the other S.S.W. Find the ship's rate.
- 33. To determine the height of an accessible object situated on an inclined plane.
- 34. At a distance of 40 ft. from the foot of a tower on an inclined plane, the tower subtends an angle of 41° 19'; at a point 60 ft. farther away, the angle subtended by the tower is 23° 45'. Find the height of the tower.
- 35. A tower makes an angle of 113° 12' with the inclined plane on which it stands; and at a distance of 89 ft. from its base, measured down the plane, the angle subtended by the tower is 23° 27'. Find the height of the tower.

- 36. From the top of a house 42 ft. high, the angle of elevation of the top of a pole is 14° 13′; at the bottom of the house it is 23° 19′. Find the height of the pole.
- 37. The sides of a triangle are 17, 21, 28; prove that the length of a line bisecting the greatest side and drawn from the opposite angle is 13.
- 38. A privateer, 10 miles S.W. of a harbor, sees a ship sail from it in a direction S. 80° E., at a rate of 9 miles an hour. In what direction, and at what rate, must the privateer sail in order to come up with the ship in $1\frac{1}{2}$ hours?
- 39. A person goes 70 yds. up a slope of 1 in $3\frac{1}{2}$ from the edge of a river, and observes the angle of depression of an object on the opposite shore to be $2\frac{1}{4}$ °. Find the breadth of the river.
- 40. The length of a lake subtends, at a certain point, an angle of 46° 24′, and the distances from this point to the two extremities of the lake are 346 and 290 ft. Find the length of the lake.
- 41. Two ships are a mile apart. The angular distance of the first ship from a fort on shore, as observed from the second ship, is 35° 14′ 10″; the angular distance of the second ship from the fort, observed from the first ship, is 42° 11′ 53″. Find the distance in feet from each ship to the fort.
- 42. Along the bank of a river is drawn a base line of 500 feet. The angular distance of one end of this line from an object on the opposite side of the river, as observed from the other end of the line, is 53°; that of the second extremity from the same object, observed at the first, is 79° 12′. Find the perpendicular breadth of the river.
- 43. A vertical tower stands on a declivity inclined 15° to the horizon. A man ascends the declivity 80 ft. from the base of the tower, and finds the angle then subtended by the tower to be 30°. Find the height of the tower.

- 44. The angle subtended by a tower on an inclined plane is, at a certain point, 42° 17′; 325 ft. farther down, it is 21° 47′. The inclination of the plane is 8° 53′. Find the height of the tower.
- 45. A cape bears north by east, as seen from a ship. The ship sails northwest 30 miles, and then the cape bears east. How far is it from the second point of observation?
- 46. Two observers, stationed on *opposite* sides of a cloud, observe its angles of elevation to be 44° 56′ and 36° 4′. Their distance from each other is 700 ft. What is the linear height of the cloud?
- 47. From a point B at the foot of a mountain, the elevation of the top A is 60° . After ascending the mountain one mile, at an inclination of 30° to the horizon, and reaching a point C, the angle ACB is found to be 135° . Find the height of the mountain in feet.
- 48. From a ship two rocks are seen in the same right line with the ship, bearing N. 15° E. After the ship has sailed northwest 5 miles, the first rock bears east, and the second northeast. Find the distance between the rocks.
- 49. From a window on a level with the bottom of a steeple the elevation of the steeple is 40°, and from a second window 18 ft. higher the elevation is 37° 30′. Find the height of the steeple.
- 50. To determine the distance between two inaccessible objects by observing angles at the extremities of a line of known length.
- 51. Wishing to determine the distance between a church A and a tower B, on the opposite side of a river, I measure a line CD along the river (C being nearly opposite A), and observe the angles ACB, 58° 20'; ACD, 95° 20'; ADB, 53° 30'; BDC, 98° 45'. CD is 600 ft. What is the distance required?

- 52. Wishing to find the height of a summit A, I measure a horizontal base line CD, 440 yds. At C, the elevation of A is 37° 18′, and the horizontal angle between D and the summit is 76° 18′; at D, the horizontal angle between C and the summit is 67° 14′. Find the height.
- 53. A balloon is observed from two stations 3000 ft. apart. At the first station the horizontal angle of the balloon and the other station is 75° 25′, and the elevation of the balloon is 18°. The horizontal angle of the first station and the balloon, measured at the second station, is 64° 30′. Find the height of the balloon.
- 54. Two forces, one of 410 pounds, and the other of 320 pounds, make an angle of 51° 37′. Find the intensity and the direction of their resultant.
- 55. An unknown force, combined with one of 128 pounds, produces a resultant of 200 pounds, and this resultant makes an angle of 18° 24′ with the known force. Find the intensity and direction of the unknown force.
- 56. At two stations, the height of a kite subtends the same angle A. The angle which the line joining one station and the kite subtends at the other station is B; and the distance between the two stations is a. Show that the height of the kite is $\frac{1}{2} a \sin A \sec B$.
- 57. Two towers on a horizontal plane are 120 ft. apart. A person standing successively at their bases observes that the angular elevation of one is double that of the other; but, when he is half-way between them, the elevations are complementary. Prove that the heights of the towers are 90 and 40 ft.
- 58. To find the distance of an inaccessible point C from either of two points A and B, having no instruments to measure angles. Prolong CA to a, and CB to b, and join AB, Ab, and Ba. Measure AB, 500; aA, 100; aB, 560; bB, 100; and Ab, 550.

- 59. Two inaccessible points A and B, are visible from D, but no other point can be found whence both are visible. Take some point C, whence A and D can be seen, and measure CD, 200 ft.; ADC, 89°; ACD, 50° 30′. Then take some point E, whence D and B are visible, and measure DE, 200; BDE, 54° 30′; BED, 88° 30′. At D measure ADB, 72° 30′. Compute the distance AB.
- 60. To compute the horizontal distance between two inaccessible points A and B, when no point can be found whence both can be seen. Take two points C and D, distant 200 yds., so that A can be seen from C, and B from D. From C measure CF, 200 yds. to F, whence A can be seen; and from D measure DE, 200 yds. to E, whence B can be seen. Measure AFC, 83°; ACD, 53° 30′; ACF, 54° 31′; BDE, 54° 30′; BDC, 156° 25′; DEB, 88° 30′.
- 61. A column in the north temperate zone is east-southeast of an observer, and at noon the extremity of its shadow is northeast of him. The shadow is 80 ft. in length, and the elevation of the column, at the observer's station, is 45°. Find the height of the column.
- 62. From the top of a hill the angles of depression of two objects situated in the horizontal plane of the base of the hill are 45° and 30°; and the horizontal angle between the two objects is 30°. Show that the height of the hill is equal to the distance between the objects.
- 63. Wishing to know the breadth of a river from A to B, I take AC, 100 yds. in the prolongation of BA, and then take CD, 200 yds. at right angles to AC. The angle BDA is 37° 18′ 30″. Find AB.
- 64. The sum of the sides of a triangle is 100. The angle at A is double that of B, and the angle at B is double that at C. Determine the sides.

- 65. If $\sin^2 A + 5 \cos^2 A = 3$, find A.
- 66. If $\sin^2 A = m \cos A n$, find $\cos A$.
- 67. Given $\sin A = m \sin B$, and $\tan A = n \tan B$, find $\sin A$ and $\cos B$.
 - 68. If $\tan^2 A + 4 \sin^2 A = 6$, find A.
 - 69. If $\sin A = \sin 2 A$, find A.
 - 70. If $\tan 2A = 3 \tan A$, find A.
 - 71. Prove that $\tan 50^{\circ} + \cot 50^{\circ} = 2 \sec 10^{\circ}$.
- 72. Given a regular polygon of n sides, and calling one of them a, find expressions for the radii of the inscribed and the circumscribed circles in terms of n and a.
- If P, H, D are the sides of a regular inscribed pentagon, hexagon, and decagon, prove $P^2 = H^2 + D^2$.

AREAS.

- 73. Obtain the formula for the area of a triangle, given two sides b, c, and the included angle A.
- 74. Obtain the formula for the area of a triangle, given two angles A and B, and included side c.
- 75. Obtain the formula for the area of a triangle, given the three sides.
- 76. If a is the side of an equilateral triangle, show that its area is $\frac{a^2\sqrt{3}}{4}$.
- 77. Two consecutive sides of a rectangle are 52.25 ch. and 38.24 ch. Find its area.
- 78. Two sides of a parallelogram are 59.8 ch. and 37.05 ch., and the included angle is 72° 10'. Find the area.
- 79. Two sides of a parallelogram are 15.36 ch. and 11.46 ch., and the included angle is 47° 30′. Find its area.

- 80. Two sides of a triangle are 12.38 ch. and 6.78 ch., and the included angle is 46° 24'. Find the area.
- 81. Two sides of a triangle are 18.37 ch. and 13.44 ch., and they form a right angle. Find the area.
- 82. Two angles of a triangle are 76° 54' and 57° 33' 12", and the included side is 9 ch. Find the area.
- 83. Two sides of a triangle are 19.74 ch. and 17.34 ch. The first bears N. 82° 30′ W.; the second S. 24° 15′ E. Find the area.
- 84. The three sides of a triangle are 49 ch., 50.25 ch., and 25.69 ch. Find the area.
- 85. The three sides of a triangle are 10.64 ch., 12.28 ch., and 9 ch. Find the area.
- 86. The sides of a triangular field, of which the area is 14 acres, are in the ratio of 3, 5, 7. Find the sides.
- 87. In the quadrilateral ABCD we have AB, 17.22 ch,; AD, 7.45 ch.; CD, 14.10 ch.; BC, 5.25 ch.; and the diagonal AC, 15.04 ch. Find the area.
- 88. The diagonals of a quadrilateral are a and b, and they intersect at an angle D. Show that the area of the quadrilateral is $\frac{1}{2}ab\sin D$.
- 89. The diagonals of a quadrilateral are 34 and 56, intersecting at an angle of 67° . Find the area.
- 90. The diagonals of a quadrilateral are 75 and 49, intersecting at an angle of 42° . Find the area.
- 91. Show that the area of a regular polygon of n sides, of which one is a, is $\frac{na^2}{4} \cot \frac{180^{\circ}}{n}$.
 - 92. One side of a regular pentagon is 25. Find the area.
 - 93. One side of a regular hexagon is 32. Find the area.

- 94. One side of a regular decagon is 46. Find the area.
- 95. Find the area of a circle whose circumference is 74 ft.
- 96. Find the area of a circle whose radius is 125 ft.
- 97. In a circle with a diameter of 125 ft. find the area of a sector with an arc of 22° .
- 98. In a circle with a radius of 44 ft. find the area of a sector with an arc of 25°.
- 99. In a circle with a diameter of 50 ft. find the area of a segment with an arc of 280° .
- 100. Find the area of a segment (less than a semicircle), of which the chord is 20, and the distance of the chord from the middle point of the smaller arc is 2.
- 101. If r is the radius of a circle, the area of a regular circumscribed polygon of n sides is $nr^2 \tan \frac{180^{\circ}}{n}$.

The area of a regular inscribed polygon is $\frac{n}{2} r^2 \sin \frac{360^{\circ}}{n}$.

102. If a is a side of a regular polygon of n sides, the area of the inscribed circle is $\frac{\pi a^2}{4} \cot^2 \frac{180^{\circ}}{n}$.

The area of the circumscribed circle is $\frac{\pi a^2}{4}\csc^2\frac{180^{\circ}}{n}$.

- 103. The area of a regular polygon inscribed in a circle is to that of the circumscribed polygon of the same number of sides as 3 to 4. Find the number of sides.
- 104. The area of a regular polygon inscribed in a circle is a geometric mean between the areas of an inscribed and a circumscribed regular polygon of half the number of sides.
- 105. The area of a circumscribed regular polygon is an harmonic mean between the areas of an inscribed regular

polygon of the same number of sides, and of a circumscribed regular polygon of half that number.

106. The perimeter of a circumscribed regular triangle is double that of the inscribed regular triangle.

107. The square described about a circle is four-thirds the inscribed dodecagon.

108. Two sides of a triangle are 3 and 12, and the included angle is 30°. Find the hypotenuse of an isosceles right triangle of equal area.

PLANE SAILING.

109. Plane Sailing is that branch of Navigation in which the surface of the earth is considered a plane. The problems which arise are therefore solved by the methods of Plane Trigonometry.

The following definitions will explain the technical terms which are employed:

The difference of latitude of two places is the arc of a meridian comprehended between the parallels of latitude passing through those places.

The *departure* between two meridians is the arc of a parallel of latitude comprehended between those meridians. It evidently diminishes as the distance from the equator at which it is measured increases.

When a ship sails in such a manner as to cross successive meridians at the same angle, it is said to sail on a *rhumb-line*. The constant angle which this line makes with the meridians is called the *course*, and the *distance* between two places is measured on a rhumb-line.

If we neglect the curvature of the earth, and consider the distance, departure, and difference of latitude of two places to

be straight lines, lying in one plane, they will form a right triangle, called the triangle of plane sailing. If ABD be a plane triangle, right-angled at D, and AD represent the difference of latitude of A and B, DAB will be the course from A to B, AB the distance, and DB the departure, measured from B, between the meridian of A and that of B.

- 110. Taking the earth's equatorial diameter to be 7925.6 miles, find the length in feet of the arc of one minute of a great circle.*
- 111. A ship sails from latitude 43° 45′ S., on a course N. by E., 2345 miles. Find the latitude reached, and the departure made.
- 112. A ship sails from latitude 1° 45′ N., on a course S.E. by E., and reaches latitude 2° 31′ S. Find the distance, and the departure.
- 113. A ship sails from latitude 13° 17′ S., on a course N.E. by E. $\frac{3}{4}$ E., until the departure is 207 miles. Find the distance, and the latitude reached.
- 114. A ship sails on a course between S. and E., 244 miles, leaving latitude 2° 52′ S., and reaching latitude 5° 8′ S. Find the course, and the departure.
- 115. A ship sails from latitude 32°18′ N., on a course between N. and W., making a distance of 344 miles, and a departure of 103 miles. Find the course, and the latitude reached
- 116. A ship sails on a course between S. and E., making a difference of latitude 136 miles, and a departure 203 miles. Find the distance, and the course.
- 117. A ship sails due north 15 statute miles an hour, for one day. What is the distance, in a straight line, from the
- * The length of the arc of one minute of a great circle of the earth is called a *geographical mile*, or a *knot*. In the following problems, this is the distance meant by the term "mile," unless otherwise stated.

point left to the point reached? (Take earth's radius, 3962.8 statute miles.)

PARALLEL AND MIDDLE LATITUDE SAILING.

- 118. The difference of longitude of two places is the angle at the pole made by the meridians of these two places; or, it is the arc of the equator comprehended between these two meridians.
- 119. In **Parallel Sailing**, a vessel is supposed to sail on a parallel of latitude; that is, either due east or due west. The distance sailed is, in this case, evidently the departure made; and the difference of longitude made depends on the solution of the following problem:
- 120. Given the departure between any two meridians at any latitude, find the angle which those meridians make, or the difference of longitude of any point on one meridian from any point on the other. (The earth is considered to be a perfect sphere, and the solution depends on simple geometric and trigonometric principles. *Cf.* Problem 7.) The solution gives the following formula:

Diff. long. = depart. \times sec. lat.

- 121. A ship in latitude 42° 16′ N., longitude 72° 16′ W., sails due east a distance of 149 miles. What is the position of the point reached?
- 122. A ship in latitude $44^{\circ}49'$ S., longitude $119^{\circ}42'$ E., sails due west until it reaches longitude $117^{\circ}16'$ E. Find the distance made.
- 123. In Middle Latitude Sailing, the departure between two places, not on the same parallel of latitude, is considered to be, approximately, the departure between the meridians of those places, measured on that parallel of latitude which lies midway between the parallels of the two places. Except in

very high latitudes or excessive runs, such an assumption produces no great error. By the formula of Art. 120, then, we shall have—

Diff. long. = depart. \times sec. mid. lat.

- 124. A ship leaves latitude 31° 14′ N., longitude 42° 19′ W., and sails E.N.E. 325 miles. Find the position reached.
- 125. Find the bearing and distance of Cape Cod from Havana. (Cape Cod, $42^{\circ}2'$ N., $70^{\circ}3'$ W.; Havana, $23^{\circ}9'$ N., $82^{\circ}22'$ W.)
- 126. Leaving latitude 49° 57′ N., longitude 15° 16′ W., a ship sails between S. and W. till the departure is 194 miles, and the latitude is 47° 18′ N. Find the course, distance, and longitude reached.
- 127. Leaving latitude 42° 30′ N., longitude 58° 51′ W., a ship sails S.E. by S. 300 miles. Find the position reached.
- 128. Leaving latitude 49° 57′ N., longitude 30° W., a ship sails S. 39° W., and reaches latitude 47° 44′ N. Find the distance, and longitude reached.
- 129. Leaving latitude 37° N., longitude 32° 16′ W., a ship sails between N. and W. 300 miles, and reaches latitude 41° N. Find the course, and longitude reached.
- 130. Leaving latitude 50° 10′ S., longitude 30° E., a ship sails E.S.E., making 160 miles' departure. Find the distance, and position reached.
- 131. Leaving latitude 49° 30′ N., longitude 25° W., a ship sails between S. and E. 215 miles, making a departure of 167 miles. Find the course, and position reached.
- 132. Leaving latitude 43° S., longitude 21° W., a ship sails 273 miles, and reaches latitude 40° 17′ S. What are the *two* courses and longitudes, either one of which will satisfy the data?

133. Leaving latitude 17° N., longitude 119° E., a ship sails 219 miles, making a departure of 162 miles. What four sets of answers do we get?

134. A ship in latitude 30° sails due east 360 statute miles. What is the shortest distance from the point left to the point reached?

Solve the same problem for latitude 45°, 60°, etc.

TRAVERSE SAILING.

135. Traverse Sailing is the application of the principles of Plane and Middle Latitude Sailing to cases when the ship sails from one point to another on two or more different courses. Each course is worked up by itself, and these independent results are combined, as may be seen in the solution of the following example:

136. Leaving latitude 37° 16′ S., longitude 18° 42′ W., a ship sails N.E. 104 miles, then N.N.W. 60 miles, then W. by S. 216 miles. Find the position reached, and its bearing and distance from the point left.

We have, for the first course, difference of latitude $73.5~\mathrm{N}$., departure $73.5~\mathrm{E}$.

We have, for the second course, difference of latitude, 55.4 N., departure 23 W.

We have, for the third course, difference of latitude 42.1 S., departure $211.8~\mathrm{W}.$

On the whole, then, the ship has made 128.9 miles of north latitude, and 42.1 miles of south latitude. The place reached is therefore on a parallel of latitude 86.8 miles to the north of the parallel left; that is, in latitude 35° 49'.2 S.

The departure is, in the same way, found to be 161.3 miles W.; and the middle latitude is 36° 32′.6. With these data,

and the formula of Art. 123, we find the difference of longitude to be 201 miles, or 3° 21′ W. Hence the longitude reached is 22° 3′ W.

With the difference of latitude 86.8 miles, and the departure 161.3 miles, we find the course to be N. 61° 43′ W., and the distance 183.2 miles. The ship has reached the same point that it would have reached, if it had sailed directly on a course N. 61° 43′ W., for a distance of 183.2 miles.

137. A ship leaves Cape Cod (Ex. 125), and sails S.E. by S. 114 miles, N. by E. 94 miles, W.N.W. 42 miles. Solve as in Ex. 136.

138. A ship leaves Cape of Good Hope (latitude 34° 22′ S., longitude 18° 30' E.), and sails N.W. 126 miles, N. by E. 84 miles, W.S.W. 217 miles. Solve as in Ex. 136.

PROBLEMS IN GONIOMETRY.

Prove that

1.
$$\sin x + \cos x = \sqrt{2} \cos (x - \frac{1}{4}\pi)$$
.

2.
$$\sin x - \cos x = -\sqrt{2}\cos(x + \frac{1}{4}\pi)$$
.

3.
$$\sin x + \sqrt{3}\cos x = 2\sin(x + \frac{1}{3}\pi)$$
.

4.
$$\sin(x + \frac{1}{3}\pi) + \sin(x - \frac{1}{3}\pi) = \sin x$$
.

5.
$$\cos(x + \frac{1}{6}\pi) + \cos(x - \frac{1}{6}\pi) = \sqrt{3}\cos x$$
.

6.
$$\tan x + \sec x = \tan(\frac{1}{2}x + \frac{1}{4}\pi)$$
.

7.
$$\tan x + \sec x = \frac{1}{\sec x - \tan x}$$

8.
$$\frac{1 - \tan x}{1 + \tan x} = \frac{\cot x - 1}{\cot x + 1}$$

8.
$$\frac{1 - \tan x}{1 + \tan x} = \frac{\cot x - 1}{\cot x + 1}.$$
9.
$$\frac{\sin x}{1 + \cos x} + \frac{1 + \cos x}{\sin x} = 2 \csc x.$$

10.
$$\tan x + \cot x = 2 \csc 2x$$
. 12. $1 + \tan x \tan 2x = \sec 2x$.

11.
$$\cot x - \tan x = 2 \cot 2x$$
. 13. $\sec 2x = \frac{\sec^2 x}{2 - \sec^2 x}$

Prove that

14.
$$2 \sec 2x = \sec (x + 45^{\circ}) \sec (x - 45^{\circ})$$
.

15.
$$\tan 2x + \sec 2x = \frac{\cos x + \sin x}{\cos x - \sin x}$$

16.
$$\sin 2x = \frac{2 \tan x}{1 + \tan^2 x}$$
 17. $2 \sin x + \sin 2x = \frac{2 \sin^3 x}{1 - \cos x}$

18.
$$\sin 3x = \frac{\sin^2 2x - \sin^2 x}{\sin x}$$

18.
$$\sin 3x = \frac{\sin^2 2x - \sin^2 x}{\sin x}$$

19. $\tan 3x = \frac{3 \tan x - \tan^3 x}{1 - 3 \tan^2 x}$
20. $\frac{\tan 2x + \tan x}{\tan 2x - \tan x} = \frac{\sin 3x}{\sin x}$

21.
$$\sin(x+y) + \cos(x-y) = 2\sin(x+\frac{1}{4}\pi)\sin(y+\frac{1}{4}\pi)$$
.

22.
$$\sin(x+y) - \cos(x-y) = -2\sin(x-\frac{1}{4}\pi)\sin(y-\frac{1}{4}\pi)$$
.

23.
$$\tan x + \tan y = \frac{\sin (x+y)}{\cos x \cos y}$$
.

24.
$$\tan(x+y) = \frac{\sin 2x + \sin 2y}{\cos 2x + \cos 2y}$$

25.
$$\frac{\sin x + \cos y}{\sin x - \cos y} = \frac{\tan \left\{ \frac{1}{2}(x+y) + 45^{\circ} \right\}}{\tan \left\{ \frac{1}{2}(x-y) - 45^{\circ} \right\}}$$

26.
$$\sin 2x + \sin 4x = 2 \sin 3x \cos x$$
.

27.
$$\sin 4x = 4 \sin x \cos x - 8 \sin^3 x \cos x$$

= $8 \cos^3 x \sin x - 4 \cos x \sin x$.

28.
$$\cos 4x = 1 - 8\cos^2 x + 8\cos^4 x = 1 - 8\sin^2 x + 8\sin^4 x$$
.

29.
$$\cos 2x + \cos 4x = 2 \cos 3x \cos 2x$$
.

30.
$$\sin 3x - \sin x = 2\cos 2x \sin x$$
.

31.
$$\sin^3 x \sin 3x + \cos^3 x \cos 3x = \cos^3 2x$$
.

32.
$$\cos^4 x - \sin^4 x = \cos 2x$$
.

33.
$$\cos^4 x + \sin^4 x = 1 - \frac{1}{2} \sin^2 2x$$
.

34.
$$\cos^6 x - \sin^6 x = \cos 2x (1 - \sin^2 x \cos^2 x)$$
.

35.
$$\cos^6 x + \sin^6 x = 1 - 3\sin^2 x \cos^2 x$$
.

$$36. \frac{\sin 3x + \sin 5x}{\cos 3x - \cos 5x} = \cot x.$$

Prove that

$$37. \frac{\sin 3x + \sin 5x}{\sin x + \sin 3x} = 2\cos 2x.$$

38.
$$\csc x - 2 \cot 2x \cos x = 2 \sin x$$
.

39.
$$(\sin 2x - \sin 2y) \tan (x+y) = 2 (\sin^2 x - \sin^2 y)$$
.

40.
$$(1 + \cot x + \tan x)(\sin x - \cos x) = \frac{\sec x}{\csc^2 x} - \frac{\csc x}{\sec^2 x}$$

41.
$$\sin x + \sin 3x + \sin 5x = \frac{\sin^2 3x}{\sin x}$$

42.
$$\frac{3\cos x + \cos 3x}{3\sin x - \sin 3x} = \cot^3 x$$
.

43.
$$\sin 3x = 4 \sin x \sin (60^{\circ} + x) \sin (60^{\circ} - x)$$
.

44.
$$\sin 4x = 2 \sin x \cos 3x + \sin 2x$$
.

45.
$$\sin x + \sin (x - \frac{2}{3}\pi) + \sin (\frac{1}{3}\pi - x) = 0$$
.

46.
$$\cos x \sin(y-z) + \cos y \sin(z-x) + \cos z \sin(x-y) = 0$$
.

47.
$$\cos(x+y)\sin y - \cos(x+z)\sin z$$

= $\sin(x+y)\cos y - \sin(x+z)\cos z$.

48.
$$\cos(x+y+z) + \cos(x+y-z) + \cos(x-y+z) + \cos(y+z-x) = 4\cos x \cos y \cos z$$
.

49.
$$\sin(x+y)\cos(x-y) + \sin(y+z)\cos(y-z) + \sin(z+x)\cos(z-x) = \sin 2x + \sin 2y + \sin 2z$$
.

50.
$$\frac{\sin 75^{\circ} + \sin 15^{\circ}}{\sin 75^{\circ} - \sin 15^{\circ}} = \tan 60^{\circ}$$
.

51.
$$\cos 20^{\circ} + \cos 100^{\circ} + \cos 140^{\circ} = 0$$
.

52.
$$\cos 36^{\circ} + \sin 36^{\circ} = \sqrt{2} \cos 9^{\circ}$$
.

53.
$$\tan 11^{\circ} 15' + 2 \tan 22^{\circ} 30' + 4 \tan 45^{\circ} = \cot 11^{\circ} 15'$$
.

If A, B, C are the angles of a plane triangle, prove that

54.
$$\sin 2A + \sin 2B + \sin 2C = 4 \sin A \sin B \sin C$$
.

55.
$$\cos 2A + \cos 2B + \cos 2C = -1 - 4\cos A\cos B\cos C$$
.

If A, B, C are the angles of a plane triangle, prove that

56.
$$\sin 3A + \sin 3B + \sin 3C = -4\cos \frac{3A}{2}\cos \frac{3B}{2}\cos \frac{3C}{2}$$

57.
$$\cos^2 A + \cos^2 B + \cos^2 C = 1 - 2\cos A\cos B\cos C$$
.

If
$$A + B + C = 90^{\circ}$$
, prove that

58.
$$\tan A \tan B + \tan B \tan C + \tan C \tan A = 1$$
.

59.
$$\sin^2 A + \sin^2 B + \sin^2 C = 1 - 2 \sin A \sin B \sin C$$
.

60.
$$\sin 2A + \sin 2B + \sin 2C = 4\cos A\cos B\cos C$$
.

61.
$$\sin(\sin^{-1}x + \sin^{-1}y) = x\sqrt{1 - y^2} + y\sqrt{1 - x^2}$$
.

62.
$$\tan(\tan^{-1}x + \tan^{-1}y) = \frac{x+y}{1-xy}$$

63.
$$2 \tan^{-1} x = \tan^{-1} \frac{2x}{1 - x^2}$$

64.
$$2\sin^{-1}x = \sin^{-1}(2x\sqrt{1-x^2})$$
.

65.
$$2\cos^{-1}x = \cos^{-1}(2x^2 - 1)$$
.

66.
$$3 \tan^{-1} x = \tan^{-1} \frac{3x - x^3}{1 - 3x^2}$$

67.
$$\sin^{-1}\sqrt{\frac{x}{y}} = \tan^{-1}\sqrt{\frac{x}{y-x}}.$$

68.
$$\sin^{-1}\sqrt{\frac{x-y}{x-z}} = \tan^{-1}\sqrt{\frac{x-y}{y-z}}$$

69.
$$\tan^{-1} \frac{1}{1 - 2x + 4x^2} + \tan^{-1} \frac{1}{1 + 2x + 4x^2} = \tan^{-1} \frac{1}{2x^2}$$

70.
$$\sin^{-1}x = \sec^{-1}\frac{1}{\sqrt{1-x^2}}$$

71.
$$2 \sec^{-1} x = \tan^{-1} \frac{2(x^2 - 1)}{2 - x^2}$$

72.
$$\tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{3} = 45^{\circ}$$
.

73.
$$\tan^{-1}\frac{1}{3} + \tan^{-1}\frac{1}{5} = \tan^{-1}\frac{4}{5}$$
.

Prove that

74.
$$\sin^{-1}\frac{3}{5} + \sin^{-1}\frac{1}{1}\frac{2}{3} = \sin^{-1}\frac{6}{6}\frac{3}{5}$$
.

75.
$$\sin^{-1}\frac{1}{\sqrt{82}} + \sin^{-1}\frac{4}{\sqrt{41}} = 45^{\circ}$$
.

76.
$$\sec^{-1}\frac{5}{3} + \sec^{-1}\frac{13}{12} = 90^{\circ}$$
.

77.
$$\tan^{-1}(2+\sqrt{3}) - \tan^{-1}(2-\sqrt{3}) = \sec^{-1}2$$
.

78.
$$\tan^{-1}\frac{1}{3} + \tan^{-1}\frac{1}{5} + \tan^{-1}\frac{1}{7} + \tan^{-1}\frac{1}{8} = 45^{\circ}$$
.

79. Given
$$\cos x = \frac{3}{5}$$
, find $\sin \frac{1}{2}x$ and $\cos \frac{1}{2}x$.

80. Given
$$\tan x = \frac{1}{2}$$
, find $\tan \frac{1}{2}x$.

81. Given
$$\sin x + \cos x = \sqrt{\frac{1}{2}}$$
, find $\cos 2x$.

82. Given
$$\tan 2x = \frac{24}{7}$$
, find $\sin x$.

83. Given
$$\cos 3x = \frac{23}{37}$$
, find $\tan 2x$.

84. Given
$$2 \csc x - \cot x = \sqrt{3}$$
, find $\sin \frac{1}{2}x$.

Solve the following equations:

86.
$$\sin x = 2 \sin \left(\frac{1}{3}\pi + x\right)$$
. 90. $\sin x + \cos 2x = 4 \sin^2 x$.

87.
$$\sin 2x = 2 \cos x$$
. 91. $4 \cos 2x + 3 \cos x = 1$.

88.
$$\cos 2x = 2\sin x$$
. 92. $\sin x + \sin 2x = \sin 3x$.

89.
$$\sin x + \cos x = 1$$
. 93. $\sin 2x = 3\sin^2 x - \cos^2 x$.

94.
$$\tan x + \tan 2x = \tan 3x$$
.

95.
$$\cot x - \tan x = \sin x + \cos x$$
.

96.
$$\tan^2 x = \sin 2x$$
. 99. $\sin x + \sin 2x = 1 - \cos 2x$.

97.
$$\tan x + \cot x = \tan 2x$$
. 100. $\sec 2x + 1 = 2\cos x$.

98.
$$\frac{1 - \tan x}{1 + \tan x} = \cos 2x$$
. 101. $\tan 2x + \tan 3x = 0$.

102.
$$\tan(\frac{1}{4}\pi + x) + \tan(\frac{1}{4}\pi - x) = 4$$
.

103.
$$\sqrt{1+\sin x} - \sqrt{1-\sin x} = 2\cos x$$
.

Solve the following equations:

- 104. $\tan x \tan 3x = -\frac{2}{5}$.
- 105. $\sin (45^{\circ} + x) + \cos (45^{\circ} x) = 1$.
- 106. $\tan x + \sec x = a$. 107. $\cos 2x = a (1 \cos x)$.
- 108. $\cos 2x (1 \tan x) = a (1 + \tan x)$.
- 109. $\sin^6 x + \cos^6 x = \frac{7}{12} \sin^2 2x$.
- 110. $\cos 3x + 8\cos^3 x = 0$.
- 111. $\sec(x+120^\circ) + \sec(x-120^\circ) = 2\cos x$.
- 112. $\csc x = \cot x + \sqrt{3}$. 114. $\cos x \cos 2x = 1$.
- 113. $4\cos 2x + 6\sin x = 5$. 115. $\sin 4x \sin 2x = \sin x$.
- 116. $2\sin^2 x + \sin^2 2x = 2$.
- 117. $\cos 5x + \cos 3x + \cos x = 0$.
- 118. $\sec x \cot x = \csc x \tan x$.
- 119. $\tan^2 x + \cot^2 x = \frac{10}{3}$.
- 120. $\sin 4x \cos 3x = \sin 2x$.
- 121. $\sin x + \cos x = \sec x$. 122. $2\cos x \cos 3x + 1 = 0$.
- 123. $\cos 3x 2\cos 2x + \cos x = 0$.
- 124. $\tan 2x \tan x = 1$.
- 125. $\sin(x+12^\circ) + \sin(x-8^\circ) = \sin 20^\circ$.
- 126. $\tan (60^{\circ} + x) \tan (60^{\circ} x) = -2$.
- 127. $\sin(x+120^\circ) + \sin(x+60^\circ) = \frac{3}{2}$.
- 128. $\sin(x+30^\circ)\sin(x-30^\circ) = \frac{1}{2}$.
- 129. $\sin^4 x + \cos^4 x = \frac{5}{8}$. 131. $\tan(x + 30^\circ) = 2\cos x$.
- 130. $\sin^4 x \cos^4 x = \frac{7}{25}$. 132. $\sec x = 2 \tan x + \frac{1}{4}$.
- 133. $\sin(x-y) = \cos x$, $\cos(x+y) = \sin x$.
- 134. $\tan x + \tan y = a$; $\cot x + \cot y = b$.
- 135. $\sin(x+12^\circ)\cos(x-12^\circ) = \cos 33^\circ \sin 57^\circ$.
- 136. $\sin^{-1}x + \sin^{-1}\frac{1}{2}x = 120^{\circ}$.
- 137. $\tan^{-1} x + \tan^{-1} 2x = \tan^{-1} 3\sqrt{3}$.
- 138. $\sin^{-1} x + 2 \cos^{-1} x = \frac{2}{3} \pi$.

Solve the following equations:

139.
$$\sin^{-1}x + 3\cos^{-1}x = 210^{\circ}$$
.

140.
$$\tan^{-1}x + 2\cot^{-1}x = 135^{\circ}$$
.

141.
$$\tan^{-1}(x+1) + \tan^{-1}(x-1) = \tan^{-1}2x$$
.

142.
$$\tan^{-1}\frac{x+2}{x+1} + \tan^{-1}\frac{x-2}{x-1} = \frac{3}{4}\pi$$
.

143.
$$\tan^{-1} \frac{2x}{1-x^2} = 60^{\circ}$$
.

Find the value of:

144.
$$a \sec x + b \csc x$$
, when $\tan x = \sqrt[3]{\frac{b}{a}}$.

145.
$$\sin 3x$$
, when $\sin 2x = \sqrt{1 - m^2}$.

146.
$$\frac{\csc^2 x - \sec^2 x}{\csc^2 x + \sec^2 x}, \text{ when } \tan x = \sqrt{\frac{1}{4}}.$$

147.
$$\sin x$$
, when $\tan^2 x + 3 \cot^2 x = 4$.

148.
$$\cos x$$
, when $5 \tan x + \sec x = 5$.

149.
$$\sec x$$
, when $\tan x = \frac{a}{\sqrt{2a+1}}$.

Simplify the following expressions:

150.
$$\frac{(\cos x + \cos y)^2 + (\sin x + \sin y)^2}{\cos^2 \frac{1}{2} (x - y)}$$

151.
$$\frac{\sin(x+2y) - 2\sin(x+y) + \sin x}{\cos(x+2y) - 2\cos(x+y) + \cos x}$$

152.
$$\frac{\sin{(x-z)} + 2\sin{x} + \sin{(x+z)}}{\sin{(y-z)} + 2\sin{y} + \sin{(y+z)}}$$

153.
$$\frac{\cos 6x - \cos 4x}{\sin 6x + \sin 4x}$$

154.
$$\tan^{-1}(2x+1) + \tan^{-1}(2x-1)$$
.

154.
$$\tan^{-1}(2x+1) + \tan^{-1}(2x-1)$$
.
155. $\frac{1}{1+\sin^2 x} + \frac{1}{1+\cos^2 x} + \frac{1}{1+\sec^2 x} + \frac{1}{1+\csc^2 x}$

156.
$$2 \sec^2 x - \sec^4 x - 2 \csc^2 x + \csc^4 x$$
.

ENTRANCE EXAMINATION PAPERS.*

PLANE TRIGONOMETRY AND LOGARITHMS.

I.

(Cornell, June, 1889.)

(One question may be omitted.)

1. Prove that

cos co-θ = sin θ;
sec
$$(\frac{1}{2}\pi + \theta)$$
 = - csc θ;
tan $(-\theta)$ = - tan θ;
csc $(\pi - \theta)$ = csc θ.

- 2. Draw the curve of tangents, and show the changes in the value of this function as the arc increases from 0° to 360°.
- 3. In terms of functions of positive angles less than 45°, express the values of $\sin 250^{\circ}$, $\csc \frac{13}{2}\pi$, $\tan \frac{16}{3}\pi$. Also find all the values of θ in terms of α when $\cos \theta = \sqrt{\sin^2 \alpha}$.
 - 4. (a) Given $\cos x = 0.5$, find $\cos 2x$ and $\tan 2x$.
 - (b) Prove that vers $(180^{\circ} A) + \text{vers} (360^{\circ} A) = 2$.
 - 5. Prove the check formulæ:

$$a+b: c = \cos \frac{1}{2} (A-B): \sin \frac{1}{2} C;$$

 $a-b: c = \sin \frac{1}{2} (A-B): \cos \frac{1}{2} C.$

* Note. In these papers, as in many text-books, the Greek letters α (alpha), β (bayta), γ (gamma), δ (delta), θ (thayta), and ϕ (phee), are occasionally used to denote angles.

- 6. In a right triangle, r (the hypotenuse) is given, and one acute angle is n times the other; find the sides about the right angle in terms of r and n.
- 7. The tower of McGraw Hall is 125 ft. high, and from its summit the angles of depression of the bases of two trees on the campus, which stand on the same level as the Hall, are respectively 57° 44′ and 16° 59′, and the angle subtended by the line joining the trees is 99° 30′. Find the distance between the trees.

II.

(Cornell, June, 1890.)

(Omit one question.)

- 1. Prove that $\cot(-\theta) = -\cot\theta$; $\csc \pi \theta = \csc\theta$; $\sin(\pi + \theta) = -\sin\theta$; $\sec \cos\theta = \csc\theta$; $\cos(\frac{1}{2}\pi + \theta) = -\sin\theta$.
 - 2. Show that in any plane triangle $\sin \frac{1}{2} A = \sqrt{\frac{(s-b)(s-c)}{bc}}$.
- 3. Find the value of $\sin (\theta \pm \theta')$ in terms of $\sin \theta$, $\cos \theta$, $\sin \theta'$, and $\cos \theta'$.
 - 4. Given $\tan 45^{\circ} = 1$; find all the functions of 22° 30′.
- 5. Determine the number of solutions of each of the triangles: a=13.4, b=11.46, $A=77^{\circ}20'$; c=58, a=75, $C=60^{\circ}$; b=109, a=94, $A=92^{\circ}10'$; c=309, b=360, $C=21^{\circ}14'25''$.
- 6. In a parallelogram, given side a, diagonal d, and the angle A formed by the diagonals; find the other diagonal and the other side.
- 7. A and B are two objects whose distance, on account of intervening obstacles, cannot be directly measured. At the summit of a hill, whose height above the common horizontal

plane of the objects is known to be 517.3 yds., angle ACB is found to be $15^{\circ}\,13'\,15''$. The angles of elevation of C viewed from A and B are $21^{\circ}\,9'\,18''$ and $23^{\circ}\,15'\,34''$ respectively. Find the distance from A to B.

III.

(Cornell, September, 1891.)

- 1. Trace the value of $\tan\theta$ and that of $\csc\theta$, as θ increases from 0° to 360°.
 - 2. (a) Find the remaining functions of θ when $\cos \theta = -\frac{1}{2}\sqrt{3}$.
- (b) Determine all the values of θ that will satisfy the relation $\cot \theta = 2 \cos \theta$.
 - 3. Prove the identity

$$\tan A - \cot A = \frac{\sin^2 A - \cos^2 A}{\sin A \cos A} = -2 \cot 2 A.$$

- 4. Derive an expression for the sine of half an angle in a triangle in terms of the sides of the triangle.
- 5. Construct a figure and explain fully (giving formulæ) how you would find the height above its base, and the distance from the observer, of an inaccessible vertical object that is visible from two points whose distance apart is known, and which can be seen from one another.
- 6. Given two sides of a plane triangle equal respectively to 121.34 and 216.7, and the included angle 47° 21′11″, to find the remaining parts of the triangle.
- 7. In a right triangle, if the difference of the base and the perpendicular is 12 yds., and the angle at the base is 38° 1′8″, what is the length of the hypotenuse?

IV.

(Cornell, June, 1892.)

- 1. By means of an equilateral triangle, one of whose angles is bisected, find the numerical values of the functions of 30° and 60° .
 - 2. If θ be any angle, prove that $\sin \theta = \tan \theta : \sqrt{1 + \tan^2 \theta}, \cos \theta = \sqrt{\csc^2 \theta 1} : \csc \theta$.
- 3. Prove that $\frac{\sin \theta + \sin \theta'}{\cos \theta \cos \theta'} = -\cot \frac{1}{2}(\theta \theta')$, where θ and θ are any angles.
 - 4. Find $\sin 2\theta$, $\cos 2\theta$, and $\tan 2\theta$, in terms of functions of θ .
 - 5. Assuming the law of sines for a plane triangle, prove that

$$\begin{array}{l} (a+b): c = \cos \frac{1}{2} \left(A - B \right) : \sin \frac{1}{2} \ C, \\ (a-b): c = \sin \frac{1}{2} \left(A - B \right) : \cos \frac{1}{2} \ C. \end{array}$$

- 6. At 120 feet distance, and on a level with the foot of a steeple, the angle of elevation of the top is 62° 27′; find the height.
 - 7. Solve the plane triangle given the three sides, a=48.76, b=62.92, c=80.24.

V.

(Harvard, June, 1889.)

- 1. In how many years will a sum of money double itself at 4 per cent., interest being compounded semi-annually?
 - 2. Given $\sin^2 x = \frac{1 + \sqrt{1 m^2}}{2}$, find $\sin 2x$ and $\tan 2x$.
- 3. Find all values of x, under 360°, which satisfy the equation $\sqrt{8\cos 2x} = 1 2\sin x$.

4. What is always the value of

 $2\sin^2 x \sin^2 y + 2\cos^2 x \cos^2 y - \cos 2x \cos 2y$?

- 5. Find the area of a parallelogram, if its diagonals are 2 and 3, and intersect each other at an angle of 35°.
- 6. Find the bearing and distance from Cape Horn (55° 55′ S., 67° 40′ W.) to Falkland Island (51° 40′ S., 59° W.).

VI.

(Harvard, June, 1890.)

1. In a certain system of logarithms $\overline{1.25}$ is the logarithm of $\frac{1}{8}$. What is the base?

Be careful to remember what $\overline{1.25}$ means.

- 2. Find the tangent of 3x in terms of the tangent of x.
- 3. One angle of a triangle is 35°, and one of the sides including this angle is 24. What are the smallest values the other sides can have?
- 4. Find all values of x, under 360°, which satisfy the equation

$$\tan 2x (\tan^2 x - 1) = 2 \sec^2 x - 6.$$

- 5. Two ships leave Cape Cod (42° N., 70° W.), one sailing E., the other sailing N.E. How many miles must each sail to reach longitude 65° W.?
 - 6. If $A + B + C = 180^{\circ}$, find the value of $\tan A + \tan B + \tan C \tan A \tan B \tan C$.

VII.

(Harvard, September, 1891.)

- 1. What is the base, when $\log 0.008 = -1.5$?
- 2. If $\cos(a-b) = 3\cos(a+b)$, find the value of $\frac{\sec(a+b)}{\sec a \sec b}$.
- 3. The area of an oblique-angled triangle is 50. One angle is 30°, and a side adjacent to that angle is 12. Solve the triangle.
- 4. Find all values of x, less than 360°, which satisfy the equation

$$\sin 2x - \cos x = \cos^2 x.$$

- 5. Find, by Middle Latitude Sailing, the course and the distance from Cape Cod (Lat. 42° 2′ N., Long. 70° 4′ W.) to Fayal (Lat. 38° 32′ N., Long. 28° 39′ W.).
 - 6. In any triangle ABC, prove $\tan \frac{1}{2}A$, $\tan \frac{1}{2}B + \tan \frac{1}{2}A \tan \frac{1}{2}C + \tan \frac{1}{2}B \tan \frac{1}{2}C = 1$.

VIII.

(Harvard, September, 1892.)

(Take the questions in any order. One of the starred questions may be omitted.)

- 1. What is the base of a system of logarithms in which $\log_{2\frac{1}{4}3} = \overline{2}.33\frac{1}{3}$?
- *2. Given the area of a right triangle, and the smallest angle, find the legs of the triangle in terms of the data.
 - *3. Find a and b, given $\frac{\sin a}{\sin b} = \sqrt{2}$, and $\frac{\tan a}{\tan b} = \sqrt{3}$.

- 4. One angle of an oblique-angled triangle is 45° , and an adjacent side is $\sqrt{2}$. What is the smallest value which the opposite side can have? Solve the triangle when the opposite side is $\frac{4}{3}$.
- 5. A ship leaves Cape Cod (42° 2′ N., 70° 4′ W.) and sails 200 knots on a course S. 40° E. Find the latitude and longitude reached.
- *6. If $2 \tan 2a = \tan 2b \sin 2b$, find the relation between the tangents of a and b.

IX.

(Harvard, June, 1893.)

(Take the problems in any order. One of the starred problems may be omitted.)

- 1. What is the base of the system of logarithms, when
 - $\log 3 = 0.3976$?
- *2. Solve the right-angled triangle in which one angle is 30°, and the difference of the legs is 4.
 - *3. Find x, given $\sec x = 2 \tan x + 2$.
- *4. One angle of a triangle is double another angle. The side opposite the first angle is three-halves of the side opposite the second angle. Find the angles.
- 5. Find, by Middle Latitude sailing, the course and distance from Funchal (32° 38' N., 16° 54' W.) to Gibraltar (36° 7' N., 5° 21' W.).
 - *6. Reduce to its simplest form $\cos 2x \tan (45^{\circ} + x) \sin 2x$.

X.

(Harvard, September, 1893.)

(One of the starred problems may be omitted.)

- 1. If the base of our system of logarithms were 20 instead of 10, what would be the logarithm of one tenth?
- *2. The area of a right triangle is 6, and the sum of the three sides is 12. Solve the triangle.
 - *3. Reduce to its simplest form

$$\cos^2 B + \sin^2 B \cos 2 A - \sin^2 A \cos 2 B.$$

- *4. Two angles of a triangle are $40^{\circ} 14'$ and $60^{\circ} 37'$. The sum of the two opposite sides is 10. Find these sides.
- 5. A ship leaves Cape of Good Hope (34° 22′ S., 18° 30′ E.), and sails N. 40° W. to Latitude 30° S. Find, by Middle Latitude Sailing, the Longitude reached and the distance sailed.
- *6. The base angles of a triangle are 22° 30′ and 112° 30′. Find the ratio between the base and the height of the triangle.

XI.

(Harvard, June, 1894.)

(Arrange your work neatly.)

- 1. What is meant by the logarithm of a number n in the system whose base is 8? What will be the logarithm of 4 in this system?
 - 2. Establish the formula:

$$\sin \frac{3}{2}x = \pm (1 + 2\cos x) \sqrt{\frac{1 - \cos x}{2}}$$

Which sign should be used when x lies in the first quadrant? When x lies in the second quadrant?

- 3. In a triangle two angles are equal to $32^{\circ} 47'$ and $49^{\circ} 28'$ respectively and the length of the included side is 0.072. Solve the triangle.
- 4. A circular tent 30 feet in diameter subtends at a certain point an angle of 15°. Find the distance of this point from the centre of the tent.
- 5. A ship leaves Latitude 42° 2′ N., Longitude 70° 3′ W., and sails N. 40° E. a distance of 420 miles. Find by Middle Latitude Sailing the position reached.

XII.

(Sheffield Scientific School, September, 1892.)

- 1. Express an angle of 60° in radians.
- 2. Represent geometrically the different trigonometric functions of an angle. State the signs of each function for each quadrant.
 - 3. Express $\tan \phi$ and $\sec \phi$ in terms of $\sin \phi$.
 - 4. Derive the formula

$$\sin \alpha + \sin \beta = 2 \sin \frac{1}{2} (\alpha + \beta) \cos \frac{1}{2} (\alpha - \beta).$$

- 5. Show that, if a, b and c are the sides of a triangle and A is the angle opposite the side a, then $a^2 = b^2 + c^2 2bc \cos A$.
 - 6. Given $\cos 2x = 2\sin x$, to find the value of $\sin x$.
- 7. Given two sides of a triangle a=450.2, b=425.4, and the included angle $C=62^{\circ}8'$; find the remaining parts.

XIII.

(Sheffield Scientific School, June, 1893.)

- 1. Express an angle of 15° in radians.
- 2. Write the simplest equivalents for $\sin(\pi+\phi)$, $\tan(2\pi-\phi)$, $\cos(\frac{3}{2}\pi-\phi)$, $\sec(\pi+\phi)$.

3. Express $\tan \phi$ in terms of $\sin \phi$, $\cos \phi$ and $\cot \phi$, respectively; and $\cos \phi$ in terms of $\tan \phi$, $\sec \phi$ and $\csc \phi$, respectively.

- 4. Show (a) that $\sin(\alpha + \beta) + \sin(\alpha \beta) = 2\sin\alpha\cos\beta$;
 - (b) that $\cos(\alpha + \beta) + \cos(\alpha \beta) = 2\cos\alpha\cos\beta$.
- 5. Assume the formula $\cos a = \frac{b^2 + c^2 a^2}{2bc}$ and show that

 $\sin^2 \frac{1}{2} a = \frac{(s-b)(s-c)}{bc}$, when $s = \frac{1}{2}(a+b+c)$.

- 6. Obtain a formula for $\tan \frac{1}{2} \alpha$ in terms of $\cos \alpha$.
- 7. The base of a triangle c=556.7, and the two adjacent angles $a=65^{\circ}20'.2$, $\beta=70^{\circ}00'.5$; calculate the area of the triangle.
 - 8. Given $0 < \alpha < 90^{\circ}$, and $\log \cos \alpha = \overline{1}.85254$, to determine α .

XIV.

(Sheffield Scientific School, September, 1893.)

- 1. Reduce an angle of 3.5 radians to degrees.
- 2. Define the different trigonometrical functions of an angle and give their algebraic signs for an angle in each quadrant.
 - 3. Write simple equivalents for the following functions: $\sin(-a)$; $\cos(-a)$; $\tan(\frac{1}{2}\pi + a)$; $\sec(\frac{3}{2}\pi a)$.
- 4. Express cosec a in terms, respectively, of $\sin a$, $\cos a$, $\tan a$, $\cot a$, $\sec a$.
 - 5. Reduce

 $(\cos a \cos \beta - \sin a \sin \beta)^2 + (\sin a \cos \beta + \cos a \sin \beta)^2$ to its simplest equivalent.

6. Show that $\tan\left(\frac{\pi}{4} - a\right) = \frac{1 - \tan a}{1 + \tan a}$.

- 7. The sum of two sides, α and b, of a triangle is 546.7 ft., the sum of the opposite angles, α and β , is 124°, and $\sin \alpha : \sin \beta = 1.003$; find the angles and sides of the triangle.
 - 8. Given $0 < \alpha < 90^{\circ}$, and $\log \cot \alpha = 0.03293$, to determine α .

XV.

(Sheffield Scientific School, June, 1894.)

- 1. Express (a) an angle of 2 radians in degrees;
 - (b) an angle of 30° in radians.
- 2. Give simple equivalents for the following functions: $\tan(-x)$, $\csc(-x)$, $\sin(x+\frac{1}{2}\pi)$, $\sin(x-\frac{1}{2}\pi)$, $\tan(\frac{3}{2}\pi-x)$, $\sin(2\pi-x)$.
- 3. Given $\tan x = \frac{a}{b}$, to express $\sin x$, $\cos x$, $\cot x$, $\sec x$, and $\cos \cos x$ in terms of a and b.
 - 4. Show that $\tan a \pm \tan b = \frac{\sin (a \pm b)}{\cos a \cos b}$
 - 5. Derive the formulæ

$$\cos \frac{1}{2}a = \pm \sqrt{\frac{1 + \cos a}{2}}, \sin \frac{1}{2}a = \pm \sqrt{\frac{1 - \cos a}{2}}.$$

- 6. Given $180^{\circ} < \phi < 270^{\circ}$, and log cot $\phi = 0.3232$, find ϕ .
- 7. The sides of a triangle are a=32.5 ft., b=33.1 ft., c=32.4 ft.: Calculate the area of the triangle and the angle C opposite the side c, using the following formulæ:

$$S = \sqrt{p(p-a)(p-b)(p-c)} = \frac{1}{2}ab \sin C$$
,

in which S denotes the area of the triangle, and $p = \frac{1}{2}(a+b+c)$.

CHAPTER VI.

CONSTRUCTION OF TABLES.

§ 42. Logarithms.

Properties of Logarithms. Any positive number being selected as a *base*, the logarithm of any other positive number is the exponent of the power to which the base must be raised to produce the given number.

Thus, if
$$a^n = N$$
, then $n = \log_a N$.

This is read, n is equal to $\log N$ to the base α .

Let a be the base, M and N any positive numbers, m and n their logarithms to the base a; so that

$$a^m = M,$$
 $a^n = N,$ $m = \log_a M,$ $n = \log_a N.$

Then, in any system of logarithms:

1. The logarithm of 1 is 0.

For,
$$a^0 = 1$$
. $\therefore 0 = \log_a 1$.

2. The logarithm of the base itself is 1.

For,
$$a^1 = a$$
. $\therefore 1 = \log_a a$.

3. The logarithm of the reciprocal of a positive number is the negative of the logarithm of the number.

For, if
$$a^n = N$$
, then $\frac{1}{N} = \frac{1}{a^n} = a^{-n}$.

$$\therefore \log_a \left(\frac{1}{N}\right) = -n = -\log_a N.$$

4. The logarithm of the product of two or more positive numbers is found by adding together the logarithms of the several factors.

For,
$$M \times N = a^m \times a^n = a^{m+n}$$
.
 $\therefore \log_a(M \times N) = m + n = \log_a M + \log_a N$.

Similarly for the product of three or more factors.

5. The logarithm of the quotient of two positive numbers is found by subtracting the logarithm of the divisor from the logarithm of the dividend.

For,
$$\frac{M}{N} = \frac{a^m}{a^n} = a^{m-n}.$$

$$\therefore \log_a \left(\frac{M}{N}\right) = m - n = \log_a M - \log_a N.$$

6. The logarithm of a power of a positive number is found by multiplying the logarithm of the number by the exponent of the power.

For,
$$N^{p} = (a^{n})^{p} = a^{np}.$$
$$\therefore \log_{a}(N^{p}) = np = p \log_{a} N.$$

7. The logarithm of the real positive value of a root of a positive number is found by dividing the logarithm of the number by the index of the root.

For,
$$\sqrt[r]{N} = \sqrt[r]{a^n} = a^{\frac{n}{r}}.$$
$$\therefore \log_a \sqrt[r]{N} = \frac{n}{r} = \frac{\log_a N}{r}.$$

Change of System. Logarithms to any base a may be converted into logarithms to any other base b as follows:

Let N be any number, and let

Then,

$$n = \log_a N$$
 and $m = \log_b N$.
 $N = a^n$ and $N = b^m$.
 $\therefore a^n = b^m$.

Hosted by Google

Taking logarithms to any base whatever,

$$n \log a = m \log b$$
,

or, $\log a \times \log_a N = \log b \times \log_b N$,

from which $\log_b N$ may be found when $\log a$, $\log b$, and $\log_a N$ are given; and conversely, $\log_a N$ may be found when $\log a$, $\log b$, and $\log_b N$ are given.

Two Important Systems. Although the number of different systems of logarithms is unlimited, there are but two systems which are in common use. These are:

- 1. The common system, also called the Briggs, denary, or decimal system, of which the base is 10.
- 2. The natural system of which the base is the fixed value which the sum of the series

$$1 + \frac{1}{1} + \frac{1}{1.2} + \frac{1}{1.2.3} + \frac{1}{1.2.3.4} + \cdots$$

approaches as the number of terms is indefinitely increased. This fixed value, correct to seven places of decimals, is 2.7182818, and is denoted by the letter e.

The common system is used in actual calculation; the natural system is used in the higher mathematics.

EXERCISE XXIII.

1. Given $\log_{10} 2 = 0.30103$, $\log_{10} 3 = 0.47712$, $\log_{10} 7 = 0.84510$ find

$$\log_{10} 6$$
, $\log_{10} 14$, $\log_{10} 21$, $\log_{10} 4$, $\log_{10} 12$, $\log_{10} 5$, $\log_{10} \frac{1}{2}$, $\log_{10} \frac{1}{4}$, $\log_{10} \frac{7}{2}$, $\log_{10} \frac{2}{2} \frac{1}{6}$.

2. With the data of example 1, find

$$\log_2 10$$
, $\log_2 5$, $\log_3 5$, $\log_{7\frac{1}{2}}$, $\log_{5\frac{3}{3}\frac{9}{43}}$.

- 3. Given $\log_{10} e = 0.43429$ find $\log_e 2$, $\log_e 3$, $\log_e 5$, $\log_e 7$, $\log_e 8$, $\log_e 9$, $\log_e \frac{2}{3}$, $\log_e \frac{4}{5}$, $\log_e \frac{3}{5}$, $\log_e \frac{7}{5}$.
- 4. Find x from the equations

$$5^x = 12$$
, $16^x = 10$, $27^x = 4$.

§ 43. Exponential and Logarithmic Series.

Exponential Series. By the binomial theorem

$$\left(1 + \frac{1}{n}\right)^{nx} = 1 + nx \times \frac{1}{n} + \frac{nx(nx - 1)}{1 \cdot 2} \times \frac{1}{n^2} + \frac{nx(nx - 1)(nx - 2)}{1 \cdot 2 \cdot 3} \times \frac{1}{n^3} + \dots \right)$$

$$= 1 + x + \frac{x\left(x - \frac{1}{n}\right)}{|2} + \frac{x\left(x - \frac{1}{n}\right)\left(x - \frac{2}{n}\right)}{|3} + \dots \tag{1}$$

This equation is true for all real values of x, since the binomial theorem may readily be extended to the case of incommensurable exponents (*College Algebra*, § 264); it is, however, only true for values of n numerically greater than 1, since $\frac{1}{n}$ must be numerically less than 1 (*College Algebra*, § 375).

As (1) is true for all values of x, it is true when x=1.

$$\therefore \left(1 + \frac{1}{n}\right)^{n} = 1 + 1 + \frac{1 - \frac{1}{n}}{2} + \frac{\left(1 - \frac{1}{n}\right)\left(1 - \frac{2}{n}\right)}{2} + \cdots$$
 (2)
But
$$\left[\left(1 + \frac{1}{n}\right)^{n}\right]^{x} = \left(1 + \frac{1}{n}\right)^{nx}$$

Hence, from (1) and (2),

$$\begin{bmatrix} 1+1+\frac{1-\frac{1}{n}}{\frac{1}{2}}+\frac{\left(1-\frac{1}{n}\right)\left(1-\frac{2}{n}\right)}{\frac{1}{3}}+\cdots \end{bmatrix}^{x}$$

$$=1+x+\frac{x\left(x-\frac{1}{n}\right)}{\frac{1}{2}}+\frac{x\left(x-\frac{1}{n}\right)\left(x-\frac{2}{n}\right)}{\frac{1}{3}}+\cdots.$$

This last equation is true for all values of n numerically greater than 1. Taking the limits of the two members as n increases without limit we obtain

$$\left(1+1+\frac{1}{|2}+\frac{1}{|3}+\cdots\right)^{x}=1+x+\frac{x^{2}}{|2}+\frac{x^{3}}{|3}+\cdots, \quad (3)$$

and this is true for all values of x. It is easily seen that both series are convergent for all values of x.

The sum of the infinite series in parenthesis is the natural base e.

Hence by (3),

$$e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots$$
 (4)

To calculate the value of e we proceed as follows:

 $\begin{array}{c|c} & 1.000000 \\ 2 & 1.000000 \\ 3 & 0.500000 \\ 4 & 0.166667 \\ 5 & 0.041667 \\ 6 & 0.008333 \\ 7 & 0.001388 \\ 8 & 0.000198 \\ 9 & 0.000025 \\ \hline 0.000003 \\ \end{array}$

Adding,

e = 2.71828.

To ten places,

e = 2.7182818284.

Limit of
$$\left(1+\frac{\mathbf{x}}{\mathbf{n}}\right)^n$$
. By the binomial theorem,
$$\left(1+\frac{x}{n}\right)^n=1+n\times\frac{x}{n}+\frac{n\left(n-1\right)}{1\cdot2}\times\frac{x^2}{n^2} + \frac{n\left(n-1\right)\left(n-2\right)}{1\cdot2\cdot3}\times\frac{x^3}{n^3}+\cdots$$

$$=1+x+\frac{1-\frac{1}{n}}{2}x^2+\frac{\left(1-\frac{1}{n}\right)\left(1-\frac{2}{n}\right)}{3}x^3+\cdots.$$

This equation is true for all values of n greater than x (College Algebra, § 375). Take the limit as n increases without limit, x remaining finite; then

$$\lim_{n \text{ infinite}} \left(1 + \frac{x}{n} \right)^n = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots$$

$$= e^x$$

$$= \lim_{n \text{ infinite}} \left(1 + \frac{1}{n} \right)^{nx}. \tag{5}$$

Logarithmic Series.

Let $y = \log_e(1+x);$ then $1+x = e^y = \underset{n \text{ infinite}}{\text{limit}} \left(1 + \frac{y}{n}\right)^n.$

If n is merely a large number, but not infinite,

$$\left(1+\frac{y}{n}\right)^n=1+x+\epsilon,$$

where ϵ is a variable number which approaches the limit 0, when n increases without limit. Hence

$$1 + \frac{y}{n} = \sqrt[n]{1 + x + \epsilon},$$
$$y = n\sqrt[n]{1 + x + \epsilon} - n.$$

If now n becomes ∞ , and consequently ϵ becomes 0, we

$$y = \lim_{n \text{ infinite}} \left[n \sqrt[n]{1+x} - n \right] \cdot$$

Assuming that x is less than 1, we may expand the right-hand member of this equation by the binomial theorem. The result is

$$y = \underset{n \text{ infinite}}{\text{limit}} \left[n \left(1 + \frac{1}{n} x + \frac{1}{n} \left(\frac{1}{n} - 1 \right) \frac{x^{2}}{2} + \cdots \right) - n \right]$$

$$= \underset{n \text{ infinite}}{\text{limit}} \left[x + \left(\frac{1}{n} - 1 \right) \frac{x^{2}}{2} + \left(\frac{1}{n} - 1 \right) \left(\frac{1}{n} - 2 \right) \frac{x^{3}}{3} + \cdots \right]$$

$$= x - \frac{x^{2}}{2} + \frac{2x^{3}}{3} - \frac{3x^{4}}{4} + \cdots$$

$$\therefore \log_{e}(1 + x) = x - \frac{x^{2}}{2} + \frac{x^{3}}{3} - \frac{x^{4}}{4} + \cdots$$

This series is known as the *logarithmic series*. It is convergent only if x lies between -1 and +1, or is equal to +1. Even within these limits it converges rather slowly, and for these reasons it is not well adapted to the computation of logarithms. A more convenient series is obtained in the following section.

Calculation of Logarithms. The equation

$$\log_e(1+y) = y - \frac{y^2}{2} + \frac{y^3}{3} - \frac{y^4}{4} + \cdots$$
 (1)

holds true for all values of y numerically less than 1; therefore, if it holds true for any particular value of y less than 1, it will hold true when we put -y for y; this gives

$$\log_e(1-y) = -y - \frac{y^2}{2} - \frac{y^3}{3} - \frac{y^4}{4} - \cdots$$
 (2)

$$\log_{e}(1+y) - \log_{e}(1-y) = \log_{e}\left(\frac{1+y}{1-y}\right),$$
we find
$$\log_{e}\left(\frac{1+y}{1-y}\right) = 2\left(y + \frac{y^{3}}{3} + \frac{y^{5}}{5} + \cdots\right).$$
Put
$$y = \frac{1}{2z+1}; \quad \text{then } \frac{1+y}{1-y} = \frac{z+1}{z},$$
and
$$\log\left(\frac{z+1}{3}\right) = \log(z+1) - \log z$$

and
$$\log_e \left(\frac{z+1}{z}\right) = \log_e(z+1) - \log_e z$$

= $2\left(\frac{1}{2z+1} + \frac{1}{3(2z+1)^3} + \frac{1}{5(2z+1)^5} + \cdots\right)$.

This series is convergent for all positive values of z.

Logarithms to any base a can be calculated by the series:

$$\log_a(z+1) - \log_a z = \frac{2}{\log_e a} \left(\frac{1}{2z+1} + \frac{1}{3(2z+1)^3} + \frac{1}{5(2z+1)^5} + \cdots \right)$$
 § 42.

Calculate log_e2 to five places of decimals.

Let
$$z=1$$
; then $z+1=2$, $2z+1=3$, and $\log_e 2 = \frac{2}{3} + \frac{2}{3 \times 3^3} + \frac{2}{5 \times 3^5} + \frac{2}{7 \times 3^7} + \cdots$.

The work may be arranged as follows:

$$\begin{array}{c} 3 \\ 9 \\ \hline 0.666667 \div 1 = 0.666667 \\ 9 \\ \hline 0.074074 \div 3 = 0.024691 \\ 9 \\ \hline 0.008230 \div 5 = 0.001646 \\ 9 \\ \hline 0.000914 \div 7 = 0.000131 \\ 9 \\ \hline 0.000102 \div 9 = 0.000011 \\ \hline 0.000011 \div 11 = 0.000001 \\ \hline \log_e 2 = \overline{0.693147} \end{array}$$

Note. In calculating logarithms the accuracy of the work may be tested every time we come to a composite number by adding together the logarithms of the several factors. In fact, the logarithms of composite numbers are best found in this way, and only the logarithms of prime numbers need be computed by the series.

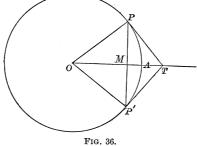

EXERCISE XXIV.

- 1. Calculate to five places of decimals $\log_e 3$, $\log_e 5$, $\log_e 7$.
- 2. Calculate to ten places of decimals $\log_e 10$.
- 3. Calculate to five places of decimals $\log_{10} 2$, $\log_{10} e$, $\log_{10} 11$.

§ 44. Trigonometric Functions of Small Angles.

Let AOP be any angle less than 90° and x its circular

measure. Describe a circle of unit radius about O as a centre and take $\angle AOP'$ $= -\angle AOP$. Draw the tangents to the circle at P and P', meeting OA in T. Then from Geometry chord $PP' < \operatorname{arc} PP'$ < PT + P'T,

or, dividing by 2

 $MP < \operatorname{arc} AP < PT$, $\sin x < x < \tan x$.

 \mathbf{or}

Hence, dividing by $\sin x$

 $1 < \frac{x}{\sin x} < \sec x,$ $1 > \frac{\sin x}{x} > \cos x. \tag{1}$

or

Then $\frac{\sin x}{x}$ lies between $\cos x$ and 1. If now the angle x is constantly diminished, $\cos x$ approaches the value 1.

Accordingly, the limit of $\frac{\sin x}{x}$, as x approaches 0, is 1; or, in other words, if x is a very small angle $\frac{\sin x}{x}$ differs from 1 by a small value ϵ , which approaches 0 as x approaches 0.

To find the sine and cosine of 1'.

If x is the circular measure of 1',

$$x = \frac{2 \pi}{360 \times 60} = \frac{3.14159 +}{10800} = 0.00029088 +,$$

the next figure in x being either 7 or 8.

Now $\sin x > 0$ but $\langle x \rangle$; hence $\sin 1'$ lies between 0 and 0.000290889.

Again

$$\cos 1' = \sqrt{1 - \sin^2 1'} > \sqrt{1 - (0.0003)^2} > 0.9999999.$$

Hence $\cos 1' = 0.99999999 +$.

But, from (1), $\sin x > x \cos x$

$$\begin{array}{l} \therefore \sin 1' > 0.000290887 \times 0.9999999 \\ > 0.000290887 \ (1-0.0000001) \\ > 0.000290887 - 0.000000000290887 \\ > 0.000290886. \end{array}$$

Hence $\sin 1'$ lies between 0.000290886 and 0.000290889; that is, to eight places of decimals

$$\sin 1' = 0.00029088 +$$

the next figure being 6, 7, or 8.

EXERCISE XXV.

Given $\pi = 3.1415926$,

- 1. Compute $\sin 1'$, $\cos 1'$, and $\tan 1'$ to as many decimal places as possible.
- 2. Compute $\sin 2'$ by the same method, and also by the formula $\sin 2x = 2 \sin x \cos x$. To how many places do the two results agree?
 - 3. Compute sin 1° to four places of decimals.
- 4. From the formula $\cos x = 1 2 \sin^2 \frac{x}{2}$, show that $\cos x > 1 \frac{x^2}{2}$.

- 5. Show by aid of a table of natural sines that $\sin x$ and x agree to four places of decimals for all angles less than 4° 40′.
- 6. If the values of $\log x$ and $\log \sin x$ agree to five decimal places, find from a table the greatest value x can have.
 - § 45. SIMPSON'S METHOD OF CONSTRUCTING A TRIGONO-METRIC TABLE.

$$\sin (A+B) + \sin (A-B) = 2\sin A\cos B.$$

If we put

$$A = x + 2y, B = y,$$

this becomes

$$\sin (x+3y) + \sin (x+y) = 2 \sin (x+2y) \cos y,$$
or
$$\sin (x+3y) = 2 \sin (x+2y) \cos y - \sin (x+y).$$
Similarly
$$\cos (x+3y) = 2 \cos (x+2y) \cos y - \cos (x+y).$$
 (1)

If y=1', the last two equations become

$$\sin(x+3') = 2\sin(x+2')\cos 1' - \sin(x+1')$$

$$\cos(x+3') = 2\cos(x+2')\cos 1' - \cos(x+1').$$

Hence, taking x successively equal to -1', 0', 1', 2', we obtain

$$\sin 2' = 2 \sin 1' \cos 1',$$

 $\sin 3' = 2 \sin 2' \cos 1' - \sin 1',$
 $\sin 4' = 2 \sin 3' \cos 1' - \sin 2',$
 $\cos 2' = 2 \cos^2 1' - 1,$
 $\cos 3' = 2 \cos 2' \cos 1' - \cos 1',$
 $\cos 4' = 2 \cos 3' \cos 1' - \cos 2',$

Since the sin 1' and cos 1' are known, these equations enable us to compute step by step the sine and cosine of any angle. The tangent may then be found in each case as the quotient of the sine divided by the cosine.

This process need be carried only as far as 30°. For

$$\sin (30^{\circ} + x) + \sin (30^{\circ} - x) = 2 \sin 30^{\circ} \cos x = \cos x,$$

$$\cos (30^{\circ} + x) - \cos (30^{\circ} - x) = -2 \sin 30^{\circ} \sin x = -\sin x,$$

$$\therefore \sin (30^{\circ} + x) = \cos x - \sin (30^{\circ} - x),$$

$$\cos (30^{\circ} + x) = -\sin x + \cos (30^{\circ} - x).$$

Moreover the sines and cosines need be calculated only to 45° , since

$$\sin (45^{\circ} + x) = \cos (45^{\circ} - x),$$

 $\cos (45^{\circ} + x) = \sin (45^{\circ} - x).$

In using this method the multiplication by cos 1', which occurs at each step, can be simplified by noting that

$$\cos 1' = 0.99999999 = 1 - 0.0000001.$$

Simpson's method is superseded in actual practice by much more rapid and convenient processes in which we employ the expansions of the trigonometric functions in infinite series.

EXERCISE XXVI.

- 1. Compute the sine and cosine of 6' to seven decimal places.
- 2. In the formula (1) let $y=1^{\circ}$. Assuming $\sin 1^{\circ}=0.017454+$, $\cos 1^{\circ}=0.999848+$, compute the sines and cosines from degree to degree as far as 4° .

Expressions of the form

$$\cos x + i \sin x$$

when $i=\sqrt{-1}$, play an important part in modern analysis.

Given two such expressions

$$\cos x + i \sin x$$
, $\cos y + i \sin y$,

their product is

$$(\cos x + i \sin x) (\cos y + i \sin y)$$

$$= \cos x \cos y - \sin x \sin y + i (\cos x \sin y + \sin x \cos y)$$

$$= \cos (x + y) + i \sin (x + y).$$

Hence, the product of two expressions of the form $\cos x + i \sin x$, $\cos y + i \sin y$ is an expression of the same form in which x or y is replaced by x + y. In other words, the angle which enters into such a product is the sum of the angles of the factors.

If x and y are equal, we have at once from the preceding

$$(\cos x + i\sin x)^2 = \cos 2x + i\sin 2x;$$

and again

$$(\cos x + i \sin x)^{3} = (\cos x + i \sin x)^{2} (\cos x + i \sin x)$$

$$= (\cos 2x + i \sin 2x) (\cos x + i \sin x)$$

$$= \cos 3x + i \sin 3x$$

Similarly $(\cos x + i \sin x)^4 = \cos 4x + i \sin 4x$, and in general if n is a positive integer

$$(\cos x + i\sin x)^n = \cos nx + i\sin nx. \tag{1}$$

Hence

To raise the expression $\cos x + i \sin x$ to the nth power when n is a positive integer, we have only to multiply the angle x by n.

Again, if n is a positive integer as before,

$$\left(\cos\frac{x}{n} + i\sin\frac{x}{n}\right)^n = \cos x + i\sin x$$

$$\therefore \left(\cos x + i\sin x\right)^{\frac{1}{n}} = \cos\frac{x}{n} + i\sin\frac{x}{n}$$

Since, however, x may be increased by any integral multiple of 2π without changing $\cos x + i \sin x$, it follows that all the x expressions

$$\cos \frac{x}{n} + i \sin \frac{x}{n}, \quad \cos \frac{x + 2\pi}{n} + i \sin \frac{x + 2\pi}{n},$$

$$\cos \frac{x + 4\pi}{n} + i \sin \frac{x + 4\pi}{n}, \dots,$$

$$\cos \frac{x + (n-1)2\pi}{n} + i \sin \frac{x + (n-1)2\pi}{n}$$

are nth roots of $\cos x + i \sin x$. There are no other roots, since

$$\cos\frac{x+n\,2\,\pi}{n} + i\sin\frac{x+n\,2\,\pi}{n}$$

$$= \cos\left(\frac{x}{n} + 2\,\pi\right) + i\sin\left(\frac{x}{n} + 2\,\pi\right) = \cos\frac{x}{n} + i\sin\frac{x}{n},$$
and
$$\cos\frac{x+(n+1)\,2\,\pi}{n} + i\sin\frac{x+(n+1)\,2\,\pi}{n}$$

$$= \cos\left(\frac{x+2\,\pi}{n} + 2\,\pi\right) + i\sin\left(\frac{x+2\,\pi}{n} + 2\,\pi\right)$$

$$= \cos\frac{x+2\,\pi}{n} + i\sin\frac{x+2\,\pi}{n},$$

and so on.

Hence, if n is a positive integer,

$$(\cos x + i\sin x)^{\frac{1}{n}}$$

$$= \cos \frac{x + 2k\pi}{n} + i\sin \frac{x + 2k\pi}{n} (k = 0, 1, 2, \dots, n - 1). \quad (2)$$

From (1) and (2) it follows at once that if m and n are positive integers

$$(\cos x + i \sin x)^{\frac{m}{n}} = \left\{ (\cos x + i \sin x)^{\frac{1}{n}} \right\}^{m}$$

$$= \cos \frac{m}{n} (x + 2k\pi) + i \sin \frac{m}{n} (x + 2k\pi) (k = 0, 1, 2, \dots, n - 1). (3)$$

Finally, if $-\frac{m}{n}$ is a negative fraction,

But
$$\frac{1}{\cos x + i \sin x} = \frac{1}{(\cos x + i \sin x)^{\frac{m}{n}}}$$

$$= \frac{\cos x - i \sin x}{(\cos x + i \sin x)(\cos x - i \sin x)}$$

$$= \frac{\cos x - i \sin x}{\cos^2 x + i \sin^2 x}$$

$$= \cos x - i \sin x$$

$$= \cos x - i \sin x$$

$$= \cos (-x) + i \sin (-x)$$

Hence

$$(\cos x + i \sin x)^{-\frac{m}{n}} = \left\{ \cos (-x) + i \sin (-x) \right\}^{\frac{m}{n}}$$

$$= \cos \frac{m}{n} (-x + 2k\pi) + i \sin \frac{m}{n} (-x + 2k\pi),$$

$$(k = 0, 1, 2, \dots, n - 1)$$

$$= \cos \left(-\frac{m}{n} (x + 2k\pi) \right) + i \sin \left(-\frac{m}{n} (-x + 2k\pi) \right),$$

$$(k = 0, 1, 2, \dots, n - 1). \tag{4}$$

Consequently if n is a positive or negative integer or fraction

$$(\cos x + i\sin x)^n = \cos \left[n \left(x + 2 k\pi \right) \right] + i\sin \left[n \left(x + 2 k\pi \right) \right],$$

$$(k = 0, 1, 2, \dots, n - 1).$$
 (5)

Example: Find the three cube roots of -1.

We have

$$-1 = \cos 180^{\circ} + i \sin 180^{\circ}$$
$$\cdot \cdot \cdot (-1)^{\frac{1}{3}} = \cos \frac{180^{\circ} + 2k\pi}{3} + i \sin \frac{180^{\circ} + 2k\pi}{3} (k = 0, 1, 2).$$

For the three cube roots of -1 we find therefore

 $\cos 60^{\circ} + i \sin 60^{\circ}$, $\cos 180^{\circ} + i \sin 180^{\circ}$, $\cos 300^{\circ} + i \sin 300^{\circ}$,

or
$$\frac{1+i\sqrt{3}}{2}, \quad -1, \quad \frac{1-i\sqrt{3}}{2}.$$

By aid of De Moivre's Theorem we may express $\sin n\theta$ and $\cos n\theta$, when n is an integer, in terms of $\sin \theta$ and $\cos \theta$.

Thus

$$\begin{aligned} \cos n\theta + i \sin n\theta &= (\cos \theta + i \sin \theta)^n \\ &= \cos^n \theta + i n \cos^{n-1} \theta \sin \theta + i^2 \frac{n(n-1)}{2} \cos^{n-2} \theta \sin^2 \theta \\ &\quad + i^3 \frac{n(n-1)(n-2)}{3} \cos^{n-3} \theta \sin^3 \theta + \cdots \end{aligned}$$

Or, since
$$i^2 = -1$$
, $i^3 = -i$, $i^4 = +1$,

$$\cos n\theta + i\sin n\theta = \cos^n\theta + in\cos^{n-1}\theta\sin\theta$$

$$-\frac{n(n-1)}{2}\cos^{n-2}\theta\sin^{2}\theta - i\frac{n(n-1)(n-2)}{|3|}\cos^{n-3}\theta\sin^{3}\theta + \dots$$

Equating now the real parts and the imaginary parts separately, we obtain

$$\cos n \theta = \cos^{n} \theta - \frac{n(n-1)}{2} \cos^{n-2} \theta \sin^{2} \theta$$

$$+ \frac{n(n-1)(n-2)(n-3)}{4} \cos^{n-4} \theta \sin^{4} \theta - \dots$$

$$\sin n \theta = n \cos^{n-1} \theta \sin \theta - \frac{n(n-1)(n-2)}{3} \cos^{n-3} \theta \sin^{3} \theta$$

$$+ \frac{n(n-1)(n-2)(n-3)(n-4)}{5} \cos^{n-5} \theta \sin^{5} \theta - \dots$$

EXERCISE XXVII.

- 1. Find the six 6th roots of -1; of +1.
- 2. Find the three cube roots of i.
- 3. Find the four 4th roots of -i.
- 4. Express $\sin 4\theta$ and $\cos 4\theta$ in terms of $\sin \theta$ and $\cos \theta$.

§ 47. Expansion of Sin x, Cos x, and Tan x in Infinite Series.

Let one radian be denoted simply by 1, and let

$$\cos 1 + i \sin 1 = k.$$

Then $\cos x + i \sin x = (\cos 1 + i \sin 1)^x = k^x$, and putting -x for x

$$\cos(-x) + i\sin(-x) = \cos x - i\sin x = k^{-x}$$
.

That is

$$\cos x + i \sin x = k^x$$

and

$$\cos x - i \sin x = k^{-x}$$

By taking the sum and difference of these two equations, and dividing the sum by 2 and the difference by 2i, we have

$$\cos x = \frac{1}{2}(k^x + k^{-x}), \quad \sin x = \frac{1}{2i}(k^x - k^{-x}).$$

But
$$k^x = (e^{\log k})^x = e^{x \log k}, \quad k^{-x} = e^{-x \log k},$$

and

$$e^{x \log k} = 1 + x \log k + \frac{x^2 (\log k)^2}{2} + \frac{x^3 (\log k)^3}{3} + \cdots$$

$$e^{-x \log k} = 1 - x \log k + \frac{x^2 (\log k)^2}{2} - \frac{x^3 (\log k)^3}{3} + \cdots$$

$$\therefore \cos x = \frac{1}{2} (k^x + k^{-x}) = 1 + \frac{x^2 (\log k)^2}{2} + \frac{x^4 (\log k)^4}{4} + \cdots$$

$$\sin x = \frac{1}{i} \left(x \log k + \frac{x^3 (\log k)^3}{3} + \frac{x^5 (\log k)^5}{5} + \cdots \right).$$

It only remains to find the value of k, and this can be obtained by dividing the last equation through by x and letting x approach 0 indefinitely, when we have

But
$$\begin{aligned} &\lim_{x \stackrel{\cdot}{=} 0} \left(\frac{\sin x}{x} \right) = \frac{1}{i} \log k. \\ &\lim_{x \stackrel{\cdot}{=} 0} \left(\frac{\sin x}{x} \right) = 1. \\ &\therefore \log k = i, \quad k = e^{i}. \end{aligned}$$

Therefore we have

$$\cos x = \frac{1}{2} (e^{xi} + e^{-xi}) = 1 - \frac{x^2}{2} + \frac{x^4}{4} - \frac{x^6}{6} + \cdots$$
$$\sin x = \frac{1}{2i} (e^{xi} - e^{-xi}) = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots.$$

From the last two series we obtain by division

$$\tan x = \frac{\sin x}{\cos x} = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \cdots$$

By the aid of these series the trigonometric functions of any angle are readily calculated. In the computation it must be remembered that x is the *circular measure* of the given angle.

EXERCISE XXVIII.

Verify by the series just obtained that

- 1. $\sin^2 x + \cos^2 x = 1$.
- 2. $\sin(-x) = -\sin x$, $\cos(-x) = \cos x$.
- 3. $\sin 2x = 2 \sin x \cos x$. 4. $\cos 2x = 1 2 \sin^2 x$.
- 5. Find the series for $\sec x$ as far as the term containing the 6th power of x.
 - 6. Find the series for $x \cot x$, noting that $x \cot x = \frac{x}{\sin x} \cos x$.
 - 7. Calculate $\sin 10^{\circ}$ and $\cos 10^{\circ}$ to 6 places of decimals.
 - 8. Calculate $\tan 15^{\circ}$ to 6 places of decimals.

From the exponential values of $\sin x$ and $\cos x$ show that

- 9. $\cos 3x = 4\cos^3 x 3\cos x$.
- 10. $\sin 3x = 3\sin x 4\sin^3 x$.

SPHERICAL TRIGONOMETRY.

CHAPTER VII.

THE RIGHT SPHERICAL TRIANGLE.

§ 48. Introduction.

THE object of *Spherical Trigonometry* is to show how spherical triangles are solved. To *solve* a spherical triangle is to compute any three of its parts when the other three parts are given.

The sides of a spherical triangle are arcs of great circles. They are measured in degrees, minutes, and seconds, and therefore by the plane angles formed by radii of the sphere drawn to the vertices of the triangle. Hence, their measures are independent of the length of the radius, which may be assumed to have any convenient numerical value; as, for example, unity.

The angles of the triangle are measured by the angles made by the planes of the sides. Each angle is also measured by the number of degrees in the arc of a great circle, described from the vertex of the angle as a pole, and included between its sides.

The sides may have any values from 0° to 360°; but in this work only sides that are less than 180° will be considered. The angles may have any values from 0° to 180°.

If any two parts of a spherical triangle are either both less than 90° or both greater than 90°, they are said to be alike in kind; but if one part is less than 90°, and the other part greater than 90°, they are said to be unlike in kind.

Spherical triangles are said to be isosceles, equilateral, equiangular, right, and oblique, under the same conditions as plane triangles. A *right* spherical triangle, however, may have one, two, or three right angles.

When a spherical triangle has one or more of its sides equal to a quadrant, it is called a quadrantal triangle.

It is shown in Solid Geometry, that in every spherical triangle

I. If two sides of a spherical triangle are unequal, the angles opposite them are unequal, and the greater angle is opposite the greater side; and conversely.

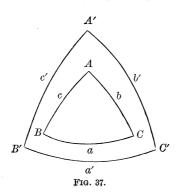

II. The sum of the sides is less than 360°.

III. The sum of the angles is greater than 180° and less than 540° .

IV. If, from the vertices as poles, arcs of great circles are described, another spherical triangle is formed so related to the first triangle that the sides of each triangle are supplements of the angles opposite them in the other triangle.

Two such triangles are called *polar* triangles, or *supplemental* triangles.

Let A, B, C (Fig. 37) denote the angles of one triangle;

a, b, c the sides opposite these angles respectively; and let A', B', C' and a', b', c' denote the corresponding sides and angles of the polar triangle. Then the above theorem gives the six following equations:

$$A + a' = 180^{\circ},$$

 $B + b' = 180^{\circ},$
 $C + c' = 180^{\circ},$
 $A' + a = 180^{\circ},$
 $B' + b = 180^{\circ},$
 $C' + c = 180^{\circ}.$

EXERCISE XXIX.

- 1. The angles of a triangle are 70°, 80°, and 100°; find the sides of the polar triangle.
- 2. The sides of a triangle are 40°, 90°, and 125°; find the angles of the polar triangle.
- 3. Prove that the polar of a quadrantal triangle is a right triangle.
- 4. Prove that, if a triangle has three right angles, the sides of the triangle are quadrants.
- 5. Prove that, if a triangle has two right angles, the sides opposite these angles are quadrants, and the third angle is measured by the number of degrees in the opposite side.
- 6. How can the sides of a spherical triangle, given in degrees, be found in units of length, when the length of the radius of the sphere is known?
- 7. Find the lengths of the sides of the triangle in Example 2, if the radius of the sphere is 4 feet.

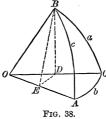

§ 49. FORMULAS RELATING TO RIGHT SPHERICAL TRIANGLES.

As is evident from § 48, Examples 4 and 5, the only kind of right spherical triangle requiring further investigation is that which contains *only one* right angle.

Let ABC (Fig. 38) be a right spherical triangle having only one right angle; and let A, B, C denote the angles of the triangle; a, b, c, respectively, the opposite sides.

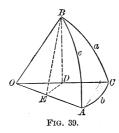

Let C be the right angle; and for the present suppose that each of the other parts is less than 90°, and that the radius of the sphere is 1.

Let planes be passed through the sides, intersecting in the radii OA, OB, and OC.

Also, let a plane perpendicular to OA be passed through B, cutting OA at E and OC at D. Draw BE, BD, and DE.

BE and DE are each \perp to OA (Geom. § 462); therefore

 $\angle BED = A$. The plane BDE is \perp to the plane AOC (Geom. § 518); hence BD, which is the intersection of the planes BDE and BOC, is \perp to the plane AOC(Geom. § 520), therefore \perp to OC and DE.

 $\cos c = OE = OD \times \cos b$ Now $OD = \cos a$. and

 $\cos c = \cos a \cos b$. [38] Therefore,

 $\sin a = BD = BE \times \sin A$, $BE = \sin c$.

Therefore, changing letters,

 $\sin a = \sin c \sin A$ [39] $\sin b = \sin c \sin B$

 $\cos A = \frac{DE}{BE} = \frac{OE \tan b}{OE \tan c}$

 $\cos \mathbf{A} = \tan \mathbf{b} \cot \mathbf{c} \\
\cos \mathbf{B} = \tan \mathbf{a} \cot \mathbf{c}$ Hence, [40] changing letters,

 $\cos A = \frac{DE}{BE} = \frac{OD\sin b}{\sin c} = \cos a \frac{\sin b}{\sin c}.$ Again,

By substituting for $\frac{\sin b}{\sin c}$ its value from [39], we obtain

 $\cos \mathbf{A} = \cos \mathbf{a} \sin \mathbf{B}$ [41]changing letters, $\cos \mathbf{B} = \cos \mathbf{b} \sin \mathbf{A}$ $\sin b = \frac{DE}{OD} = \frac{BD \cot A}{\cos a} = \frac{\sin a \cot A}{\cos a}$ Also,

 $\sin b = \tan a \cot A$ Hence, [42] $\sin a = \tan b \cot B$ changing letters,

If in $\lceil 38 \rceil$ we substitute for $\cos a$ and $\cos b$ their values from $\lceil 41 \rceil$, we obtain $\cos c = \cot A \cot B$.

Note. In order to deduce the second formulas in [39]-[42] geometrically, the auxiliary plane must be passed through $A \perp$ to OB.

[43]

These ten formulas are sufficient for the solution of any right spherical triangle.

In deducing these formulas, it has been assumed that all the parts of the triangle, except the right angle, are less than 90°. But the formulas also hold true when this hypothesis is not fulfilled.

Let one of the legs a be greater than 90°, and construct a figure for this case (Fig. 39) in the same manner as Fig. 38.

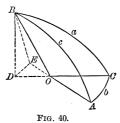

Fig. 41.

The auxiliary plane BDE will now cut both CO and AO produced beyond the centre O; and we have

$$\cos c = -OE = -OD \cos DOE$$

$$= (-\cos a) (-\cos b)$$

$$= \cos a \cos b.$$

Likewise, the other formulas, [39]–[43], hold true in this case. Again, suppose that both the legs a and b are greater than 90°. In this case the plane BDE (Fig. 40) will cut CO produced beyond O, and AO between A and O; and we have

$$\cos c = OE = OD \cos DOE$$

$$= (-\cos a) (-\cos b)$$

$$= \cos a \cos b,$$

a result agreeing with [38]. And the remaining formulas may be easily shown to hold true.

Like results follow in all cases; in other words, Formulas [38]-[43] are universally true.

Exercise XXX.

- 1. Prove, by aid of Formula [38], that the hypotenuse of a right spherical triangle is less than or greater than 90°, according as the two legs are alike or unlike in kind.
- 2. Prove, by aid of Formula [41], that in a right spherical triangle each leg and the opposite angle are always alike in kind.
- 3. What inferences may be drawn from Formulas [38]–[43] respecting the values of the other parts: (i.) if $c=90^{\circ}$; (ii.) if $a=90^{\circ}$; (iii.) if $c=90^{\circ}$ and $a=90^{\circ}$; (iv.) if $a=90^{\circ}$ and $b=90^{\circ}$?

Deduce from [38]-[43] and [18]-[23] the following formulas:

4. $\tan^2 \frac{1}{2}b = \tan \frac{1}{2}(c-a) \tan \frac{1}{2}(c+a)$.

Hint. Use Formula [18] and substitute in it the value of $\cos b$ in [38].

- 5. $\tan^2(45^\circ \frac{1}{2}A) = \tan\frac{1}{2}(c-a)\cot\frac{1}{2}(c+a)$.
- 6. $\tan^2 \frac{1}{2} B = \sin(c a) \csc(c + a)$.
- 7. $\tan^2 \frac{1}{2}c = -\cos(A+B)\sec(A-B)$.
- 8. $\tan^2 \frac{1}{2}a = \tan \left[\frac{1}{2}(A+B) 45^\circ\right] \tan \left[\frac{1}{2}(A-B) + 45^\circ\right]$.
- 9. $\tan^2(45^\circ \frac{1}{2}c) = \tan\frac{1}{2}(A-a)\cot\frac{1}{2}(A+a)$.
- 10. $\tan^2(45^\circ \frac{1}{2}b) = \sin(A a)\csc(A + a)$.
- 11. $\tan^2(45^\circ \frac{1}{2}B) = \tan\frac{1}{2}(A-a)\tan\frac{1}{2}(A+a)$.

§ 50. Napier's Rules.

The ten formulas deduced in § 49 express the relations between five parts of a right triangle, the three sides and the two oblique angles. All these relations may be shown to follow from two very useful Rules, devised by Baron Napier, the inventor of logarithms.

For this purpose the right angle (not entering the formulas) is left out of account, and instead of the hypotenuse and the two oblique angles, their respective complements are employed; so that the five parts considered by the Rules are: a, b, co. A, co. c, co. B. Any one of these parts may be called a middle part; and then the two parts immediately adjacent are called adjacent parts, and the other two are called opposite parts.

Rule I. The sine of the middle part is equal to the product of the tangents of the adjacent parts.

Rule II. The sine of the middle part is equal to the product of the cosines of the opposite parts.

These Rules are easily remembered by the expressions, tan. ad. and cos. op.

The correctness of these Rules may be shown by taking

each of the five parts as middle part, and comparing the resulting equations with the equations contained in Formulas [38]–[43].

For example, let co. c be taken as middle part, then co. A and co. B are the adjacent parts, and a and b the opposite parts, as is very plainly seen in Fig. 41. Then, by Napier's Rules:

$$\sin(co. c) = \tan(co. A) \tan(co. B),$$
or
$$\cos c = \cot A \cot B;$$

$$\sin(co. c) = \cos a \cos b,$$
or
$$\cos c = \cos a \cos b;$$

results which agree with Formulas [38] and [43] respectively.

 $c_{0. A}$

EXERCISE XXXI.

- 1. Show that Napier's Rules lead to the equations contained in Formulas [39], [40], [41], and [42].
- 2. What will Napier's Rules become, if we take as the five parts of the triangle, the hypotenuse, the two oblique angles, and the *complements* of the two legs?

§ 51. Solution of Right Spherical Triangles.

By means of Formulas [38]-[43] we can solve a right triangle in all possible cases. In every case two parts besides the right angle must be given.

Case I. Given the two legs a and b.

The solution is contained in Formulas [38] and [42]; viz.:

 $\cos c = \cos a \cos b,$ $\tan A = \tan a \csc b,$ $\tan B = \tan b \csc a.$

For example, let $a=27^{\circ}$ 28' 36", $b=51^{\circ}$ 12' 8"; then the solution by logarithms is as follows:

 $\log \cos a = 9.94802$ $\log \cos b = 9.79697$ $\log \cos c = 9.74499$ $c = 56^{\circ} 13' 40''$

Case II. Given the hypotenuse c and the leg a. From Formulas [38], [39], and [40] we obtain

 $\cos b = \cos c \sec a,$ $\sin A = \sin a \csc c,$ $\cos B = \tan a \cot c.$ Although two angles in general correspond to $\sin A$, one acute the other obtuse, yet in this case the indetermination is removed by the fact that A and a must be alike in kind (see Exercise XXX., Example 2).

Case III. Given the leg a and the opposite angle A.

By means of Formulas [39], [41], and [42], we find, that

 $\sin c = \sin a \csc A$, $\sin b = \tan a \cot A$, $\sin B = \sec a \cos A$;

or, from [38] and [40],

 $\cos b = \cos c \sec a,$ $\cos B = \tan a \cot c.$

When c has been computed, b and B are determined by these values of their cosines; but, since c must be found

from its sine, c may have in general two values which are supplements of each other. This case, c therefore, really admits of two solutions.

In fact, if the sides b and c are extended until they meet in A' (Fig. 42), the two right triangles ABC and A'BC have the side a in common, and the angle A = A'. Also $A'C = 180^{\circ} - b$, $A'B = 180^{\circ} - c$, and $\angle A'BC = 180^{\circ} - B$.

Case IV. Given the leg a and the adjacent angle B.

Formulas $\lceil 40 \rceil$, $\lceil 41 \rceil$, and $\lceil 42 \rceil$ give

 $\tan c = \tan a \sec B,$ $\tan b = \sin a \tan B,$ $\cos A = \cos a \sin B.$ Case V. Given the hypotenuse c and the angle A.

From Formulas [39], [40], and [43] it follows that

 $\sin a = \sin c \sin A$,

 $\tan b = \tan c \cos A,$

 $\cot B = \cos c \tan A$.

Here a is determined by $\sin a$, since a and A must be alike in kind (see Exercise XXX., Example 2).

Case VI. Given the two angles A and B.

By means of Formulas [41] and [43] we obtain

 $\cos c = \cot A \cot B,$

 $\cos a = \cos A \csc B,$

 $\cos b = \cos B \csc A$.

Note 1. In Case I. (a and b given) the formula for computing c fails to give accurate results when c is very near 0° or 180° ; in this case it may be found with greater accuracy by first computing B, and then computing c, as in Case IV.

Note 2. In Case II. (c and a given), if b is very near 0° or 180° , it may be computed more accurately by means of the derived formula

$$\tan^2 \frac{1}{2} b = \tan \frac{1}{2} (c + a) \tan \frac{1}{2} (c - a).$$
 (Ex. 4, § 49.)

And if A is so near 90° that it cannot be found accurately in the Tables, it may be computed from the derived formula

$$\tan^2(45^\circ - \frac{1}{2}A) = \tan\frac{1}{2}(c-a)\cot\frac{1}{2}(c+a).$$
 (Ex. 5, § 49.)

In like manner, when B cannot be accurately found from its cosine we may make use of the formula

$$\tan^2 \frac{1}{2} B = \sin(c - a) \csc(c + a).$$
 (Ex. 6, § 49.)

Note 3. In Case III. (a and A given), when the formulas for the required parts do not give accurate results, we may employ the derived formulas

$$\tan^2 (45^\circ - \frac{1}{2}c) = \tan \frac{1}{2}(A-a) \cot \frac{1}{2}(A+a),$$
 (Ex. 9, § 49.)

$$\tan^2(45^\circ - \frac{1}{2}b) = \sin(A - a)\csc(A + a),$$
 (Ex. 10, § 49.)

$$\tan^2(45^\circ - \frac{1}{2}B) = \tan\frac{1}{2}(A-a)\tan\frac{1}{2}(A+a).$$
 (Ex. 11, § 49.)

- Note 4. In Case IV. (a and B given), if A is near 0° or 180° , it may be more accurately found by first computing b and then finding A.
- Note 5. In Case V. (c and A given), if a is near 90°, it may be found by first computing b, and then computing a by means of Formula [42].
- Note 6. In Case VI. (A and B given), for unfavorable values of the sides greater accuracy may be obtained by means of the derived formulas

$$\tan^2 \frac{1}{2} c = -\cos (A + B) \sec (A - B), \qquad (Ex. 7, \S 49.)$$

$$\tan^2 \frac{1}{2} a = \tan \left[\frac{1}{2} (A + B) - 45^\circ \right] \tan \left[45^\circ + \frac{1}{2} (A - B) \right], \quad (Ex. 8, \S 49.)$$

$$\tan^2 \frac{1}{2} b = \tan \left[\frac{1}{2} (A + B) - 45^\circ \right] \tan \left[45^\circ - \frac{1}{2} (A - B) \right].$$

- Note 7. In Cases I., IV., and V., the solution is always possible. In the other Cases, in order that the solution may be possible, it is necessary and sufficient that in Case II. $\sin \alpha < \sin c$; in Case III., that a and A be alike in kind, and $\sin A > \sin a$; in Case VI., that A + B + C be $> 180^{\circ}$, and the difference of A and B be $< 90^{\circ}$.
- Note 8. It is easy to trace analogies between the formulas for solving right spherical triangles and those for solving right plane triangles. The former, in fact, become identical with the latter if we suppose the radius of the sphere to be infinite in length; in which case the cosines of the sides become each equal to 1, and the ratios of the sines of the sides and of the tangents of the sides must be taken as equal to the ratios of the sides themselves.
- Note 9. In solving spherical triangles, the algebraic sign of the functions must receive careful attention. If the sign of each function is written just above it, the sign of the function in the first member will be + or according to the rule that like signs give + and unlike signs give -.

If the function is a cos, tan, or cot, the + sign shows that the angle is less than 90°; the - sign shows that the angle is greater than 90°, and the *supplement* of the angle obtained from the table must be taken.

If the function is a sine, since the sine of an angle and its supplement are the same, the acute angle obtained from the table and its supplement must be considered as solutions, unless there are other conditions that remove the ambiguity. For the conditions that remove the ambiguity, in case of right spherical triangles see examples 1 and 2 in Exercise XXX., and in case of oblique spherical triangles see I. of § 48.

Note 10. The solutions of a spherical triangle may conveniently be tested by substituting them in the formula containing the three required parts.

If the formula required for any case is not remembered, it is always easy to find it by means of Napier's Rules. In applying these Rules we must choose for the middle part that one of the three parts considered — the two given and the one required — which will make the other two either adjacent parts or opposite parts.

For example: given a and B; solve the triangle.

First, represent the parts as in Fig. 43, and to prevent

mistakes mark each of the given parts with a cross. To find b, take a as the middle part; then b and co. B are adjacent parts; and by Rule I.,

Rule I., $\sin a = \tan b \cot B;$ whence, $\tan b = \sin a \tan B.$ To find a take co. B as middle

To find c, take co. B as middle part; then a and co. c are adjacent parts; and by Rule I.,

whence, $\cos B = \tan a \cot c;$ $\tan c = \tan a \sec B.$

Fig. 44. To find A, take co. A as middle part; then a and co. B are the opposite parts; and by Rule II.,

 $\cos A = \cos a \sin B$.

In like manner, every case of a right spherical triangle may be solved.

EXERCISE XXXII.

Solve the following right triangles, taking for the given parts in each case those printed in columns I. and II.:

	I.			II.			III.			IV.			v.		
	a			b			c			A			В		
1	36°	27′		43°	32′	31′′	54°					$43.2^{\prime\prime}$			19.3′′

				1160								46"			58"
21	460	59'	42"	57°	59'	17"	36°	27'		430	32'	30′′	54°	20'	
22	90°			880	24'	35′′	900			880	24'	35′′	900		

Note. The values in the last three columns of example 9 cannot be combined promiscuously with those given in columns I. and II.

Since $a < 90^\circ$, with the value of $b > 90^\circ$ must be taken angle $B > 90^\circ$ and $c > 90^\circ$; while with the value of $b < 90^\circ$ must be taken, for the same reason, angle $B < 90^\circ$ and $c < 90^\circ$. Exercise XXX., 1 and 2.

- 23. Define a quadrantal triangle, and show how its solution may be reduced to that of the right triangle.
 - 24. Solve the quadrantal triangle whose sides are: $a=174^{\circ}\ 12'\ 49.1'',\ b=94^{\circ}\ 8'\ 20'',\ c=90^{\circ}.$
 - 25. Solve the quadrantal triangle in which $e=90^{\circ}$, $A=110^{\circ}\,47'\,50''$, $B=135^{\circ}\,35'\,34.5''$.
- 26. Given in a spherical triangle A, C, and c each equal to 90°; solve the triangle.
 - 27. Given $A = 60^{\circ}$, $C = 90^{\circ}$, and $c = 90^{\circ}$; solve the triangle.
- 28. Given in a right spherical triangle, $A=42^{\circ}$ 24' 9", $B=9^{\circ}$ 4' 11"; solve the triangle.
- 29. In a right spherical triangle, given $a = 119^{\circ} 11'$, $B = 126^{\circ} 54'$; solve the triangle.
- 30. In a right spherical triangle, given $c=50^{\circ}$, $b=44^{\circ}18'39''$; solve the triangle.
- 31. In a right spherical triangle, given $A = 156^{\circ} 20' 30''$, $a = 65^{\circ} 15' 45''$; solve the triangle.
- 32. If the legs a and b of a right spherical triangle are equal, prove that $\cos a = \cot A = \sqrt{\cos c}$.
 - 33. In a right spherical triangle prove that $\cos^2 A \times \sin^2 c = \sin(c-a)\sin(c+a)$.
 - 34. In a right spherical triangle prove that $\tan a \cos c = \sin b \cot B$.
 - 35. In a right spherical triangle prove that $\sin^2 A = \cos^2 B + \sin^2 a \sin^2 B$.
 - 36. In a right spherical triangle prove that $\sin (b+c) = 2 \cos^2 \frac{1}{2} A \cos b \sin c$.
 - 37. In a right spherical triangle prove that $\sin (c b) = 2 \sin^2 \frac{1}{2} A \cos b \sin c$.
- 38. If, in a right spherical triangle, p denotes the arc of the great circle passing through the vertex of the right angle and perpendicular to the hypotenuse, m and n the segments of the hypotenuse made by this arc adjacent to the legs a and b, prove that (i.) $\tan^2 a = \tan c \tan m$, (ii.) $\sin^2 p = \tan m \tan n$.

§ 52. Solution of the Isosceles Spherical Triangle.

If an arc of a great circle is passed through the vertex of an isosceles spherical triangle and the middle point of its base, the triangle will be divided into two symmetrical right spherical triangles. In this way the solution of an isosceles spherical triangle may be reduced to that of a right spherical triangle.

In a similar manner the solution of a regular spherical polygon* may be reduced to that of a right spherical triangle. Arcs of great circles, passed through the centre of the polygon and its vertices, divide it into a series of equal isosceles triangles; and each one of these may be divided into two equal right triangles.

EXERCISE XXXIII.

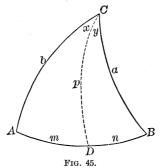

- 1. In an isosceles spherical triangle, given the base b and the side a; find A the angle at the base, B the angle at the vertex, and h the altitude.
- 2. In an equilateral spherical triangle, given the side α ; find the angle A.
- 3. Given the side a of a regular spherical polygon of n sides; find the angle A of the polygon, the distance R from the centre of the polygon to one of its vertices, and the distance r from the centre to the middle point of one of its sides.
- 4. Compute the dihedral angles made by the faces of the five regular polyhedrons.
- 5. A spherical square is a regular spherical quadrilateral. Find the angle A of the square, having given the side a.
- *A regular spherical polygon is the polygon formed by the intersections of the spherical surface by the faces of a regular pyramid whose vertex is at the centre of the sphere.

CHAPTER VIII.

THE OBLIQUE SPHERICAL TRIANGLE.

§ 53. Fundamental Formulas.

Let ABC (Fig. 44) be an oblique spherical triangle, a, b, c

its three sides, A, B, C the angles opposite to them, respectively.

Through C draw an are CD of a great circle, perpendicular to the side AB, meeting AB at D. For brevity let CD = p, AD = m, BD = n, $\angle ACD = x$, $\angle BCD = y$.

1. By § 49 [38], in the right triangles BDC and ADC, $\sin p = \sin a \sin B$, and $\sin p = \sin b \sin A$.

Therefore, $\sin a \sin B = \sin b \sin A$ similarly, $\sin a \sin C = \sin c \sin A$ and $\sin b \sin C = \sin c \sin B$ [44]

These equations may also be written in the form of proportions

 $\sin a : \sin b : \sin c = \sin A : \sin B : \sin C$.

That is, the sines of the sides of a spherical triangle are proportional to the sines of the opposite angles.

In Fig. 44 the arc of the great circle CD cuts the side AB within the triangle. In case it cuts AB produced without the triangle, $\sin (180^{\circ}-A)$, $\sin (180^{\circ}-B)$, or $\sin (180^{\circ}-C)$, would

be employed in the above proof instead of $\sin A$, $\sin B$, or $\sin C$. These sines, however, are equal to $\sin A$, $\sin B$, and $\sin C$, respectively, so that the Formulas [44] hold true in all cases.

2. In the right triangle BDC, by § 49 [38],

$$\cos a = \cos p \cos n = \cos p \cos (c - m),$$
or (§ 28)
$$\cos a = \cos p \cos c \cos m + \cos p \sin c \sin m.$$
Now,
$$\cos p \cos m = \cos b;$$
 [38]
whence
$$\cos p = \cos b \sec m,$$
and
$$\cos p \sin m = \cos b \tan m$$

$$= \cos b \tan b \cos A$$
 [40]
$$= \sin b \cos A.$$

Substituting these values of $\cos p \cos m$ and $\cos p \sin m$ in the value of $\cos a$, we obtain

and similarly,
$$\cos a = \cos b \cos c + \sin b \sin c \cos A$$

 $\cos b = \cos a \cos c + \sin a \sin c \cos B$
 $\cos c = \cos a \cos b + \sin a \sin b \cos C$
[45]

3. In the right triangle ADC, by [41],

$$\cos A = \cos p \sin x = \cos p \sin (C - y),$$
or (§ 28)
$$\cos A = \cos p \sin C \cos y - \cos p \cos C \sin y.$$
Now,
$$\cos p \sin y = \cos B;$$
whence,
$$\cos p = \cos B \csc y,$$
and
$$\cos p \cos y = \cos B \cot y$$

$$= \cos B \tan B \cos a$$

$$= \sin B \cos a.$$
[43]

Substituting these values of $\cos p \sin y$ and $\cos p \cos y$ in the value of $\cos A$, we obtain

and similarly,
$$\cos A = -\cos B \cos C + \sin B \sin C \cos a$$

 $\cos B = -\cos A \cos C + \sin A \sin C \cos b$
 $\cos C = -\cos A \cos B + \sin A \sin B \cos c$

Formulas [45] and [46] are also universally true; for the same equations are obtained when the arc CD cuts the side AB without the triangle.

EXERCISE XXXIV.

- 1. What do Formulas [44] become if $A = 90^{\circ}$? if $B = 90^{\circ}$? if $C = 90^{\circ}$? if $A = 90^{\circ}$? if $A = B = 90^{\circ}$? if $a = b = 90^{\circ}$?
- 2. What does the first of [45] become if $A=0^{\circ}$? if $A=90^{\circ}$? if $A=180^{\circ}$?
- 3. From Formulas [45] deduce Formulas [46], by means of the relations between polar triangles (§ 48).
 - § 54. FORMULAS FOR THE HALF ANGLES AND SIDES.

From the first equation of $\lceil 45 \rceil$,

$$\cos A = \frac{\cos a - \cos b \cos c}{\sin b \sin c};$$

whence,

$$1 - \cos A = \frac{\sin b \sin c + \cos b \cos c - \cos a}{\sin b \sin c}$$
$$= \frac{\cos (b - c) - \cos a}{\sin b \sin c};$$

$$1 + \cos A = \frac{\sin b \sin c - \cos b \cos c + \cos a}{\sin b \sin c}$$
$$= \frac{\cos a - \cos (b + c)}{\sin b \sin c}.$$

Hence, by § 30 [16] and [17], and § 31 [23],

$$\sin^2 \frac{1}{2} A = \sin \frac{1}{2} (a + b - c) \sin \frac{1}{2} (a - b + c) \csc b \csc c,$$

$$\cos^2 \frac{1}{2} A = \sin \frac{1}{2} (a + b + c) \sin \frac{1}{2} (b + c - a) \csc b \csc c.$$

Now let
$$\frac{1}{2}(a+b+c) = s;$$
 whence,
$$\frac{1}{2}(b+c-a) = s-a,$$

$$\frac{1}{2}(a-b+c) = s-b,$$

$$\frac{1}{2}(a+b-c) = s-c.$$

Then, by substitution and extraction of the square root,

$$\begin{array}{l} \sin\frac{1}{2}\mathbf{A} = \sqrt{\sin\left(\mathbf{s} - \mathbf{b}\right)\sin\left(\mathbf{s} - \mathbf{c}\right)\csc\mathbf{b}\csc\mathbf{c}} \\ \cos\frac{1}{2}\mathbf{A} = \sqrt{\sin\mathbf{s}\sin\left(\mathbf{s} - \mathbf{a}\right)\csc\mathbf{b}\csc\mathbf{c}} \\ \tan\frac{1}{2}\mathbf{A} = \sqrt{\csc\mathbf{s}\csc\left(\mathbf{s} - \mathbf{a}\right)\sin\left(\mathbf{s} - \mathbf{b}\right)\sin\left(\mathbf{s} - \mathbf{c}\right)} \end{array} \right] \end{aligned}$$

In like manner, it may be shown that

$$\begin{array}{l} \sin\frac{1}{2} \ B = \sqrt{\sin{(s-a)}} \sin{(s-c)} \csc{a} \csc{c} \\ \cos\frac{1}{2} \ B = \sqrt{\sin{s}} \sin{(s-b)} \csc{a} \csc{c} \\ \tan\frac{1}{2} \ B = \sqrt{\csc{s}} \csc{(s-b)} \sin{(s-a)} \sin{(s-c)} \\ \sin\frac{1}{2} \ C = \sqrt{\sin{(s-a)}} \sin{(s-b)} \csc{a} \csc{b} \\ \cos\frac{1}{2} \ C = \sqrt{\sin{s}} \sin{(s-c)} \csc{a} \csc{b} \\ \tan\frac{1}{2} \ C = \sqrt{\csc{s}} \csc{(s-c)} \sin{(s-a)} \sin{(s-b)} \end{array}$$

Again, from the first equation of [46],

$$\cos a = \frac{\cos B \cos C + \cos A}{\sin B \sin C};$$

whence,

$$1 - \cos a = \frac{\sin B \sin C - \cos B \cos C - \cos A}{\sin B \sin C},$$

$$1 + \cos a = \frac{\sin B \sin C + \cos B \cos C + \cos A}{\sin B \sin C}.$$

If we place $\frac{1}{2}(A+B+C)=S$, and proceed in the same manner as before, we obtain the following results:

$$\begin{array}{l} \sin\frac{1}{2}\,\mathbf{a} = \sqrt{-\cos\mathbf{S}\cos\left(\mathbf{S} - \mathbf{A}\right)\csc\mathbf{B}\csc\mathbf{C}} \\ \cos\frac{1}{2}\,\mathbf{a} = \sqrt{\cos\left(\mathbf{S} - \mathbf{B}\right)\cos\left(\mathbf{S} - \mathbf{C}\right)\csc\mathbf{B}\csc\mathbf{C}} \\ \tan\frac{1}{2}\,\mathbf{a} = \sqrt{-\cos\mathbf{S}\cos\left(\mathbf{S} - \mathbf{A}\right)\sec\left(\mathbf{S} - \mathbf{B}\right)\sec\left(\mathbf{S} - \mathbf{C}\right)} \end{array} \right\} \quad \begin{bmatrix} 48 \end{bmatrix}$$

And, in like manner,

$$\sin \frac{1}{2}b = \sqrt{-\cos S \cos (S - B) \csc A \csc C}$$

$$\cos \frac{1}{2}b = \sqrt{\cos (S - A) \cos (S - C) \csc A \csc C}$$

$$\tan \frac{1}{2}b = \sqrt{-\cos S \cos (S - B) \sec (S - A) \sec (S - C)}$$

$$\sin \frac{1}{2}c = \sqrt{-\cos S \cos (S - C) \csc A \csc B}$$

$$\cos \frac{1}{2}c = \sqrt{\cos (S - A) \cos (S - B) \csc A \csc B}$$

$$\tan \frac{1}{2}c = \sqrt{-\cos S \cos (S - C) \sec (S - A) \sec (S - B)}$$

 \S 55. Gauss's Equations and Napier's Analogies. By \S 27 [5],

$$\cos \frac{1}{2}(A+B) = \cos \frac{1}{2}A\cos \frac{1}{2}B - \sin \frac{1}{2}A\sin \frac{1}{2}B;$$

or, by substituting for $\cos \frac{1}{2} A$, $\cos \frac{1}{2} B$, $\sin \frac{1}{2} A$, $\sin \frac{1}{2} B$, their values given in § 54, and reducing,

$$\cos \frac{1}{2}(A+B) = \sqrt{\frac{\sin s \sin (s-a)}{\sin b \sin c}} \times \sqrt{\frac{\sin s \sin (s-b)}{\sin a \sin c}}$$

$$-\sqrt{\frac{\sin (s-b) \sin (s-c)}{\sin b \sin c}} \times \sqrt{\frac{\sin (s-a) \sin (s-c)}{\sin a \sin c}}$$

$$= \frac{\sin s - \sin (s-c)}{\sin c} \times \sqrt{\frac{\sin (s-a) \sin (s-b)}{\sin a \sin b}}$$

This value, by applying §§ 29 [12], 31 [21], and observing that the expression under the radical is equal to $\sin \frac{1}{2} C$, becomes

$$\cos \frac{1}{2} (A+B) = \frac{2 \sin \frac{1}{2} c \cos (s - \frac{1}{2} c)}{2 \sin \frac{1}{2} c \cos \frac{1}{2} c} \sin \frac{1}{2} C;$$

and this, by cancelling common factors, clearing of fractions, and observing that $s - \frac{1}{2}c = \frac{1}{2}(a+b)$, reduces to the form

$$\cos \frac{1}{2}(A+B)\cos \frac{1}{2}c = \cos \frac{1}{2}(a+b)\sin \frac{1}{2}C.$$

By proceeding in like manner with the values of $\sin \frac{1}{2}(A+B)$, $\cos \frac{1}{2}(A-B)$, and $\sin \frac{1}{2}(A-B)$, three analogous equations are obtained.

The four equations,

$$\begin{array}{c} \cos\frac{1}{2}(\mathbf{A} + \mathbf{B})\cos\frac{1}{2}\mathbf{c} = \cos\frac{1}{2}(\mathbf{a} + \mathbf{b})\sin\frac{1}{2}\mathbf{C} \\ \sin\frac{1}{2}(\mathbf{A} + \mathbf{B})\cos\frac{1}{2}\mathbf{c} = \cos\frac{1}{2}(\mathbf{a} - \mathbf{b})\cos\frac{1}{2}\mathbf{C} \\ \cos\frac{1}{2}(\mathbf{A} - \mathbf{B})\sin\frac{1}{2}\mathbf{c} = \sin\frac{1}{2}(\mathbf{a} + \mathbf{b})\sin\frac{1}{2}\mathbf{C} \\ \sin\frac{1}{2}(\mathbf{A} - \mathbf{B})\sin\frac{1}{2}\mathbf{c} = \sin\frac{1}{2}(\mathbf{a} - \mathbf{b})\cos\frac{1}{2}\mathbf{C} \end{array} \right]$$

are called Gauss's Equations.

By dividing the second of Gauss's Equations by the first, the fourth by the third, the third by the first, and the fourth by the second, we obtain

$$\tan \frac{1}{2} (\mathbf{A} + \mathbf{B}) = \frac{\cos \frac{1}{2} (\mathbf{a} - \mathbf{b})}{\cos \frac{1}{2} (\mathbf{a} + \mathbf{b})} \cot \frac{1}{2} \mathbf{C}
\tan \frac{1}{2} (\mathbf{A} - \mathbf{B}) = \frac{\sin \frac{1}{2} (\mathbf{a} - \mathbf{b})}{\sin \frac{1}{2} (\mathbf{a} + \mathbf{b})} \cot \frac{1}{2} \mathbf{C}
\tan \frac{1}{2} (\mathbf{a} + \mathbf{b}) = \frac{\cos \frac{1}{2} (\mathbf{A} - \mathbf{B})}{\cos \frac{1}{2} (\mathbf{A} + \mathbf{B})} \tan \frac{1}{2} \mathbf{c}
\tan \frac{1}{2} (\mathbf{a} - \mathbf{b}) = \frac{\sin \frac{1}{2} (\mathbf{A} - \mathbf{B})}{\sin \frac{1}{2} (\mathbf{A} + \mathbf{B})} \tan \frac{1}{2} \mathbf{c}$$
[50]

There will be other forms in each case, according as other elements of the triangle are used.

These equations are called Napier's Analogies.

In the first equation the factors $\cos\frac{1}{2}(a-b)$ and $\cot\frac{1}{2}C$ are always positive: therefore, $\tan\frac{1}{2}(A+B)$ and $\cos\frac{1}{2}(a+b)$ must always have like signs. Hence, if $a+b<180^\circ$, and therefore $\cos\frac{1}{2}(a+b)>0$, then, also, $\tan\frac{1}{2}(A+B)>0$, and therefore $A+B<180^\circ$. Similarly, it follows that if $a+b>180^\circ$, then, also, $A+B>180^\circ$. If $a+b=180^\circ$, and therefore $\cos\frac{1}{2}(a+b)=0$, then $\tan\frac{1}{2}(A+B)=\infty$; whence $\frac{1}{2}(A+B)=90^\circ$, and $A+B=180^\circ$.

Conversely, it may be shown from the third equation, that a+b is less than, greater than, or equal to 180°, according as A+B is less than, greater than, or equal to 180°.

Given two sides, a and b, and the included angle C.

The angles A and B may be found by the first two of Napier's Analogies; viz.:

$$\tan \frac{1}{2} (A + B) = \frac{\cos \frac{1}{2} (a - b)}{\cos \frac{1}{2} (a + b)} \cot \frac{1}{2} C.$$

$$\tan \frac{1}{2} (A - B) = \frac{\sin \frac{1}{2} (a - b)}{\sin \frac{1}{2} (a + b)} \cot \frac{1}{2} C.$$

After A and B have been found, the side c may be found by [44] or by [50]; but it is better to use for this purpose Gauss's Equations, because they involve functions of the same angles that occur in working Napier's Analogies. Any one of the equations may be used; for example, from the first we have

$$\cos \frac{1}{2} \, c = \frac{\cos \frac{1}{2} \, (a+b)}{\cos \frac{1}{2} \, (A+B)} \sin \frac{1}{2} \, C.$$
 Example. $a = 73^{\circ} \, 58' \, 54''$, therefore, $\frac{1}{2} \, (a-b) = 17^{\circ} \, 36' \, 57'$, $b = 38^{\circ} \, 45' \, 0''$, $\frac{1}{2} \, (a+b) = 56^{\circ} \, 21' \, 57''$ $C = 46^{\circ} \, 33' \, 41''$, $\frac{1}{2} \, C = 23^{\circ} \, 16' \, 50.5''$ $\frac{1}{2} \, (a+b) = 56^{\circ} \, 21' \, 57''$ $\frac{1}{2} \, (a+b) = 56^{\circ} \, 21' \, 57''$ $\frac{1}{2} \, (a+b) = 56^{\circ} \, 21' \, 57''$ $\frac{1}{2} \, (a+b) = 9.48092$ $\log \cot \frac{1}{2} \, C = 0.36626$ $\log \cot \frac{1}{2} \, (a+b) = 0.07956$ $\log \cot \frac{1}{2} \, C = 0.36626$ $\log \cot \frac{1}{2} \, (a+b) = 9.92674$ $\frac{1}{2} \, (a+B) = 75^{\circ} \, 57' \, 40.7''$ $\frac{1}{2} \, (a+B) = 75^{\circ} \, 57' \, 40.7''$ $\frac{1}{2} \, (a+B) = 40^{\circ} \, 11' \, 25.6''$ $\frac{A = 116^{\circ} \, 9' \, 6.3''}{B = 35^{\circ} \, 46' \, 15.1'}$ $\frac{A = 116^{\circ} \, 9' \, 6.3''}{C = 51^{\circ} \, 2'}$

If the side c only is desired, it may be found from [45], without previously computing A and B. But the Formulas [45] are not adapted to logarithmic work. Instead of changing them to forms suitable for logarithms, we may use the following method, which leads to the same results, and has the advantage that, in applying it, nothing has to be remembered except Napier's Rules:

Make the triangle (Fig. 45), as in § 53, equal to the sum

(or the difference) of two right triangles. For this purpose, through B (or A, but not C) draw an arc of a great circle perpendicular to AC, cutting AC at D. Let BD = p, CD = m, AD = n; and mark with crosses the given parts.

By Rule I.,

 $\cos C = \tan m \cot a,$

whence $\tan m = \tan a \cos C$.

By Rule II.,

Fig. 46.

Therefore, $\cos c \sec n = \cos a \sec m$; or, since n = b - m, $\cos c = \cos a \sec m \cos (b - m)$.

It is evident that c may be computed, with the aid of logarithms, from the two equations

$$\tan m = \tan a \cos C,$$

 $\cos c = \cos a \sec m \cos (b - m).$

Example. Given $a = 97^{\circ} 30' 20''$, $b = 55^{\circ} 12' 10''$, $C = 39^{\circ} 58'$; find c.

EXERCISE XXXV.

1. Write formulas for finding, by Napier's Rules, the side a, when b, c, and A are given, and for finding the side b when a, c, and B are given.

2. Given $a=88^{\circ}\ 12'\ 20''$, $b=124^{\circ}\ 7'\ 17''$, $C=50^{\circ}\ 2'\ 1''$; find $A=63^{\circ}\ 15'\ 11''$, $B=132^{\circ}\ 17'\ 59''$, $c=59^{\circ}\ 4'\ 18''$.

3. Given $a = 120^{\circ} 55' 35''$, $b = 88^{\circ} 12' 20''$, $C = 47^{\circ} 42' 1''$; find $A = 129^{\circ} 58' 3''$, $B = 63^{\circ} 15' 9''$, $c = 55^{\circ} 52' 40''$.

4. Given $b=63^{\circ}\ 15'\ 12'',\ c=47^{\circ}\ 42'\ 1'',\ A=59^{\circ}\ 4'\ 25'';$ find $B=88^{\circ}\ 12'\ 24'',\ C=55^{\circ}\ 52'\ 42'',\ a=50^{\circ}\ 1'\ 40''.$

5. Given $b = 69^{\circ} 25' 11''$, $c = 109^{\circ} 46' 19''$, $A = 54^{\circ} 54' 42''$; find $B = 56^{\circ} 11' 57''$, $C = 123^{\circ} 21' 12''$, $a = 67^{\circ} 13'$.

Given the side c and the two adjacent angles A and B.

The sides a and b may be found by the third and fourth of Napier's Analogies,

$$\tan \frac{1}{2} (a+b) = \frac{\cos \frac{1}{2} (A-B)}{\cos \frac{1}{2} (A+B)} \tan \frac{1}{2} c,$$

$$\tan \frac{1}{2} (a-b) = \frac{\sin \frac{1}{2} (A-B)}{\sin \frac{1}{2} (A+B)} \tan \frac{1}{2} c,$$

and then the angle C may be found by [44], by Napier's second Analogy, or by one of Gauss's equations, as, for instance, the second, which gives

$$\cos \frac{1}{2} C = \frac{\sin \frac{1}{2} (A + B)}{\cos \frac{1}{2} (a - b)} \cos \frac{1}{2} c.$$

Fig. 47.

 $\log \sin (B - x) = 9.88122$ $\log \csc x = 0.04055$

 $\log \cos C = 9.83099$

=9.90992

 $C = 47^{\circ} 20' 30''$

If the angle C alone is wanted, the best way is to decompose the triangle into two right triangles, and then apply Napier's Rules, as in Case I., when the side c alone is desired.

Let (Fig. 46)
$$\angle ABD = x$$
, $\angle CBD = y$, $BD = p$; then,

Rule I.,

 $\cos c = \cot x \cot A,$

whence $\cot x = \tan A \cos c$.

Rule II.,

 $\cos A = \cos p \sin x,$

whence $\cos p = \cos A \csc x$.

 $\cos C = \cos p \sin y$,

whence $\cos p = \cos C \csc y$.

Hence
$$\cos C = \cos A \csc x \sin y$$

= $\cos A \csc x \sin (B-x)$.

It is clear that C may be computed from the equations

$$\cot x = \tan A \cos c,$$

$$\cos C = \cos A \csc x \sin (B - x).$$

Example. Given $A = 35^{\circ} 46' 15''$, $B = 115^{\circ} 9' 7''$, $c = 51^{\circ} 2'$; find C.

 $\log \cos A$

EXERCISE XXXVI.

- 1. What are the formulas for computing A when B, C, and a are given; and for computing B when A, C, and b are given?
- 2. Given $A = 26^{\circ} 58' 46''$, $B = 39^{\circ} 45' 10''$, $c = 154^{\circ} 46' 48''$; find $a = 37^{\circ} 14' 10''$, $b = 121^{\circ} 28' 10''$, $C = 161^{\circ} 22' 11''$.
- 3. Given $A = 128^{\circ} 41' 49''$, $B = 107^{\circ} 33' 20''$, $e = 124^{\circ} 12' 31''$; find $a = 125^{\circ} 41' 44''$, $b = 82^{\circ} 47' 34''$, $C = 127^{\circ} 22'$.

- 4. Given $B = 153^{\circ} 17' 6''$, $C = 78^{\circ} 43' 36''$, $a = 86^{\circ} 15' 15''$; find $b = 152^{\circ} 43' 51''$, $c = 88^{\circ} 12' 21''$, $A = 78^{\circ} 15' 48''$.
- 5. Given $A = 125^{\circ} 41' 44''$, $C = 82^{\circ} 47' 35''$, $b = 52^{\circ} 37' 57''$; find $a = 128^{\circ} 41' 46''$, $c = 107^{\circ} 33' 20''$, $B = 55^{\circ} 47' 40''$.

Given two sides a and b, and the angle A opposite to a.

The angle B is found from [44], whence we have $\sin B = \sin A \sin b \csc a$.

When B has been found, C and c may be found from the fourth and the second of Napier's Analogies, from which we obtain

$$\tan \frac{1}{2} c = \frac{\sin \frac{1}{2} (A + B)}{\sin \frac{1}{2} (A - B)} \tan \frac{1}{2} (a - b),$$

$$\cot \frac{1}{2} C = \frac{\sin \frac{1}{2} (a + b)}{\sin \frac{1}{2} (a - b)} \tan \frac{1}{2} (A - B).$$

`The third and first of Napier's Analogies may also be used.

Note 1. Since B is determined from its sine, the problem in general has two solutions; and, moreover, in case $\sin B > 1$, the problem is impossible. By geometric construction it may be shown, as in the corresponding case in Plane Trigonometry, under what conditions the problem really has two solutions, one solution, and no solution. But in practical applications a general knowledge of the shape of the triangle is known beforehand; so that it is easy to see, without special investigation, which solution (if any) corresponds to the circumstances of the question.

It can be shown that there are two solutions, when A and a are alike in kind and $\sin b > \sin a > \sin A \sin b$; no solution when A and a are unlike in kind (including the case in which either A or a is 90°) and $\sin b$ is greater than or equal to $\sin a$, or when $\sin a < \sin A \sin b$; and one solution in every other case.

Note 2. The side c or the angle C may be computed, without first finding B, by means of the formulas

 $\tan m = \cos A \tan b$, and $\cos (c - m) = \cos a \sec b \cos m$, $\cot x = \tan A \cos b$, and $\cos (C - x) = \cot a \tan b \cos x$.

These formulas may be obtained by resolution of the triangle into right triangles, and applying Napier's Rules; m is equal to that part of the side c included between the vertex A and the foot of the perpendicular from C, and x is equal to the corresponding portion of the angle C.

Note 3. After the two values of B have been obtained, the number of solutions may readily be determined by § 48 - I. If $\log \sin B$ is positive, there will be no solution.

Example. Given $a = 57^{\circ} 36'$, $b = 31^{\circ} 12'$, $A = 104^{\circ} 25' 30''$.

```
In this case
                               A > 90^{\circ},
                                                              \log \sin A = 9.98609
and
                          a + b < 180^{\circ};
                                                              \log \sin b = 9.71435
therefore,
                        A + B < 180^{\circ};
                                                              \log \csc a = 0.07349
                                                              \log \sin \overline{B} = 9.77393
                                B < 90^{\circ},
hence,
                                                                        B = 36^{\circ} \, 27' \, 20''
and only one solution.
                                                                     \frac{1}{2}(a+b) = 44^{\circ}25'
                a + b = 88^{\circ}50'
               a - b = 26^{\circ} 26'
                                                                     \frac{1}{2}(a-b) = 13^{\circ}13'
              A + B = 140^{\circ} 51' 53''
                                                                     \frac{1}{2}(A+B) = 70^{\circ} 26' 25''
                                                                     \frac{1}{2}(A-B) = 33^{\circ}59' \ 5''
              A - B = 67^{\circ}59' 7''
\log \sin \frac{1}{2} (A + B) = 9.97416
                                                           \log \sin \frac{\pi}{2} (a+b) = 9.84502
\log \csc \frac{1}{2} (A - B) = 0.25252
                                                           \log \csc \frac{1}{2} (a - b) = 0.64086
                                                           \frac{\log \tan \frac{1}{2} (A - B)}{\log \tan \frac{1}{2} (A - B)} = 9.82873
\log \tan \frac{1}{2} (a - b) = 9.37080
          \log \tan \frac{1}{2} c = 9.59748
                                                                    \log \cot \frac{1}{2} C = 0.31461
                                                                               \frac{1}{2} C = 25^{\circ} 51' 15''
                     \frac{1}{2}c = 21^{\circ}35'38''
                                                                                 C = 51^{\circ} 42' 30''
                       c = 43^{\circ} \, 11' \, 16''
```

EXERCISE XXXVII.

- 1. Given $a = 73^{\circ} 49' 38''$, $b = 120^{\circ} 53' 35''$, $A = 88^{\circ} 52' 42''$; find $B = 116^{\circ} 42' 30''$, $c = 120^{\circ} 57' 27''$, $C = 116^{\circ} 47' 4''$.
- 3. Given $a = 79^{\circ}.0'.54.5''$, $b = 82^{\circ}.17'.4''$, $A = 82^{\circ}.9'.25.8''$; find $B = 90^{\circ}$, $c = 45^{\circ}.12'.19''$, $C = 45^{\circ}.44'$.
- 4. Given $a = 30^{\circ} 52' 36.6''$, $b = 31^{\circ} 9' 16''$, $A = 87^{\circ} 34' 12''$; show that the triangle is impossible.

Given two angles A and B, and the side a opposite to one of

The side b is found from $\lceil 44 \rceil$, whence

$$\sin b = \sin a \sin B \csc A$$
.

The values of c and C may then be found by means of Napier's Analogies, the fourth and second of which give

$$\tan \frac{1}{2} c = \frac{\sin \frac{1}{2} (A+B)}{\sin \frac{1}{2} (A-B)} \tan \frac{1}{2} (a-b),$$

$$\cot \frac{1}{2} C = \frac{\sin \frac{1}{2} (a+b)}{\sin \frac{1}{2} (a-b)} \tan \frac{1}{2} (A-B).$$

$$\cot \frac{1}{2}C = \frac{\sin \frac{1}{2}(a+b)}{\sin \frac{1}{2}(a-b)} \tan \frac{1}{2}(A-B).$$

Note 1. In this case the conditions for one, two, or no solutions can be deduced directly by the theory of polar triangles from the corresponding conditions of Case III. There are two solutions, when A and a are alike in kind and $\sin B > \sin A > \sin a \sin B$; no solution when A and a are unlike in kind (including the case in which either A or a is 90°) and $\sin B$ is greater than or equal to $\sin A$, or when $\sin A < \sin a \sin B$; and one solution in every other case.

Note 2. By proceeding as indicated in Case III., Note 2, formulas for computing c or C, independent of the side b, may be found; viz.:

$$\tan m = \tan a \cos B$$
, and $\sin (c - m) = \cot A \tan B \sin m$, $\cot x = \cos a \tan B$, and $\sin (C - x) = \cos A \sec B \sin x$.

In these formulas m = BD, $x = \angle BCD$, D being the foot of the perpendicular from the vertex C.

Note 3. As in Case III., only those values of b can be retained which are greater or less than a, according as B is greater or less than A. If $\log \sin b$ is positive, the triangle is impossible.

EXERCISE XXXVIII.

1. Given $A = 110^{\circ} 10'$, $B = 133^{\circ} 18'$, $a = 147^{\circ} 5' 32''$; find $b = 155^{\circ} 5' 18''$, $c = 33^{\circ} 1' 36''$, $C = 70^{\circ} 20' 40''$.

- 2. Given $A = 113^{\circ} 39' 21''$, $B = 123^{\circ} 40' 18''$, $a = 65^{\circ} 39' 46''$; find $b = 124^{\circ} 7' 20''$, $c = 159^{\circ} 50' 14''$, $C = 159^{\circ} 43' 34''$.
- 3. Given $A = 100^{\circ} 2'11.3''$, $B = 98^{\circ} 30'28''$, $a = 95^{\circ} 20'38.7''$; find $b = 90^{\circ}$, $c = 147^{\circ} 41'43''$, $C = 148^{\circ} 5''33''$.
- 4. Given $A = 24^{\circ} 33' 9''$, $B = 38^{\circ} 0' 12''$, $a = 65^{\circ} 20' 13''$; show that the triangle is impossible.

Given the three sides, a, b, and c.

The angles are computed by means of Formulas [47], and the corresponding formulas for the angles B and C.

The formulas for the tangent are in general to be preferred. If we multiply the equation

$$\tan \frac{1}{2}A = \sqrt{\csc s \csc (s-a)\sin (s-b)\sin (s-c)}$$

by the equation

$$1 = \frac{\sin(s-a)}{\sin(s-a)}, \text{ and put}$$

$$\sqrt{\csc s \sin (s-a) \sin (s-b) \sin (s-c)} = \tan r,$$

and also make analogous changes in the equations for $\tan \frac{1}{2} B$ and $\tan \frac{1}{2} C$, we obtain

$$\tan \frac{1}{2} A = \tan r \csc (s - a),$$

$$\tan \frac{1}{2} B = \tan r \csc (s - b),$$

$$\tan \frac{1}{2} C = \tan r \csc (s - c),$$

which are the most convenient formulas to employ when all three angles have to be computed.

Example 1.
$$a = 50^{\circ} 54' 32''$$
 $b = 37^{\circ} 47' 18''$ $c = 74^{\circ} 51' 50''$ $2s = 163^{\circ} 33' 40''$ $s = 81^{\circ} 46' 50''$ $s - a = 30^{\circ} 52' 18''$ $s - b = 43^{\circ} 59' 32''$ $s - c = 6^{\circ} 55' 0''$ $a = 50.00448$ $a = 0.00488$ $a = 0.0048$ $a = 0.00488$ $a = 0.0048$

EXERCISE XXXIX.

- 1. Given $a=120^{\circ} 55' 35''$, $b=59^{\circ} 4' 25''$, $c=106^{\circ} 10' 22''$; find $A=116^{\circ} 44' 50''$, $B=63^{\circ} 15' 18''$, $C=91^{\circ} 7' 22''$.
- 2. Given $a = 50^{\circ} 12' 4''$, $b = 116^{\circ} 44' 48''$, $c = 129^{\circ} 11' 42''$; find $A = 59^{\circ} 4' 28''$, $B = 94^{\circ} 23' 12''$, $C = 120^{\circ} 4' 52''$.
- 3. Given $a = 131^{\circ} 35' 4''$, $b = 108^{\circ} 30' 14''$, $c = 84^{\circ} 46' 34''$; find $A = 132^{\circ} 14' 21''$, $B = 110^{\circ} 10' 40''$, $C = 99^{\circ} 42' 24''$.
- 4. Given $a = 20^{\circ} 16' 38''$, $b = 56^{\circ} 19' 40''$, $c = 66^{\circ} 20' 44''$; find $A = 20^{\circ} 9' 54''$, $B = 55^{\circ} 52' 31''$, $C = 114^{\circ} 20' 17''$.

Given the three angles, A, B, and C.

The sides are computed by means of Formulas [48]. The formulas for the tangents are in general to be preferred.

If we multiply the equation

$$\tan \frac{1}{2}a = \sqrt{-\cos S \cos (S-a) \sec (S-B) \sec (S-C)}$$

by the equation

$$1 = \frac{\sec(S - A)}{\sec(S - A)}, \text{ and put}$$

$$\sqrt{-\cos S \sec (S-A) \sec (S-B) \sec (S-C)} = \tan R,$$

and also make analogous changes in the equations for $\tan \frac{1}{2}b$ and $\tan \frac{1}{2}c$, we obtain

$$\tan \frac{1}{2}a = \tan R \cos (S - A),$$

$$\tan \frac{1}{2}b = \tan R \cos (S - B),$$

$$\tan \frac{1}{2}c = \tan R \cos (S - C),$$

which are the most convenient formulas to use in case all three angles have to be computed.

In Example 1, after we find the values of S, S-A, S-B, S-C, we write the formula for $\tan \frac{1}{2}a$ with the algebraic sign written above each function as follows:

$$\tan \frac{1}{2}a = \sqrt{-\cos S \cos (S-A) \sec (S-B) \sec (S-C)}.$$
Example 1. $A = 220^{\circ}$
 $B = 130^{\circ}$
 $C = 150^{\circ}$
 $2S = 500^{\circ}$
 $S = A = 30^{\circ}$
 $S - B = 120^{\circ}$
 $S - C = 100^{\circ}$

$$\cos S = 9.53405 (n)$$

$$\log \cos (S-A) = 9.93753$$

$$\log \sec (S-B) = 0.30103 (n)$$

$$\log \sec (S-C) = 0.76033 (n)$$

$$2)0.53294$$

$$\log \tan \frac{1}{2}a = 0.26647$$

$$a = 123^{\circ} 8' 12''$$

Note. Here the effect, as regards algebraic sign, of three negative factors, is cancelled by the negative sign belonging to the whole product.

In Example 2, after we find the values of S, S-A, S-B, S-C, we write the formula for $\tan R$ with the algebraic sign written above each function as follows:

$$\tan R = \sqrt{-\cos S} \sec (S-A) \sec (S-B) \sec (S-C).$$
 Example 2. $A = 20^{\circ} 9' 56''$ $S = 95^{\circ} 11' 21''$ $S - A = 75^{\circ} 1' 25''$ $S - B = 39^{\circ} 18' 49''$ $S - C = -19^{\circ} 8' 53''$ $S - C = -19^{\circ} 8' 53''$

EXERCISE XL.

- 1. Given $A = 130^{\circ}$, $B = 110^{\circ}$, $C = 80^{\circ}$; find $a = 139^{\circ}$ 21' 22", $b = 126^{\circ}$ 57' 52", $c = 56^{\circ}$ 51' 48".
- 2. Given $A = 59^{\circ} 55' 10''$, $B = 85^{\circ} 36' 50''$, $C = 59^{\circ} 55' 10''$; find $a = 51^{\circ} 17' 31''$, $b = 64^{\circ} 2' 47''$, $c = 51^{\circ} 17' 31''$.
- 3. Given $A = 102^{\circ} 14' 12''$, $B = 54^{\circ} 32' 24''$, $C = 89^{\circ} 5' 46''$; find $a = 104^{\circ} 25' 9''$, $b = 53^{\circ} 49' 25''$, $c = 97^{\circ} 44' 19''$.
- 4. Given $A=4^{\circ} 23' 35''$, $B=8^{\circ} 28' 20''$, $C=172^{\circ} 17' 56''$; find $a=31^{\circ} 9' 14''$, $b=84^{\circ} 18' 28''$, $c=115^{\circ} 10'$.

§ 62. Area of a Spherical Triangle.

I. When the three angles, A, B, C, are given.

Let R = radius of sphere, $E = \text{the spherical excess} = A + B + C - 180^{\circ},$ F = area of triangle.

Three planes passed through the centre of a sphere, each perpendicular to the other two planes, divide the surface of the sphere into eight tri-rectangular triangles.

It is convenient to divide each of these eight triangles into 90 equal parts, and to call these parts spherical degrees. The surface of every sphere, therefore, contains 720 spherical degrees.

Since in spherical degrees, the $\triangle ABC = E$, and the entire surface of the sphere is equal to 720 spherical degrees,

$$\therefore \triangle ABC$$
: surface of the sphere = $E:720$;

or, since the surface of a sphere = $4\pi R^2$,

$$\triangle ABC: 4\pi R^2 = E:720$$

whence

$$\mathbf{F} = \frac{\pi \,\mathbf{R}^2 \,\mathbf{E}}{180} \tag{51}$$

II. When the three sides, a, b, c, are given.

A formula for computing the area is deduced as follows: From the first of $\lceil 49 \rceil$,

$$\frac{\cos\frac{1}{2}\left(A+B\right)}{\cos\left(90^{\circ}-\frac{1}{2}C\right)}\!=\!\frac{\cos\frac{1}{2}\left(a+b\right)}{\cos\frac{1}{2}c};$$

whence, by the Theory of Proportions,

$$\frac{\cos\frac{1}{2}(A+B) - \cos(90^{\circ} - \frac{1}{2}C)}{\cos\frac{1}{2}(A+B) + \cos(90^{\circ} - \frac{1}{2}C)} = \frac{\cos\frac{1}{2}(a+b) - \cos\frac{1}{2}c}{\cos\frac{1}{2}(a+b) + \cos\frac{1}{2}c}$$
(a)

Now, in § 31, the division of [23] by [22] gives

$$\frac{\cos A - \cos B}{\cos A + \cos B} = -\tan \frac{1}{2} (A + B) \tan \frac{1}{2} (A - B),$$
 (b)

in which for A and B we may substitute any other two angular magnitudes, as for example, $\frac{1}{2}(A+B)$ and $(90-\frac{1}{2}C)$, or $\frac{1}{2}(a+b)$ and $\frac{1}{2}c$.

If we use in place of A and B the values $\frac{1}{2}(A+B)$ and $(90^{\circ} - \frac{1}{2}C)$, the first side of equation (b) becomes

$$\frac{\cos\frac{1}{2}\left(A+B\right)-\cos\left(90^{\circ}-\frac{1}{2}\right.C\right)}{\cos\frac{1}{2}\left(A+B\right)+\cos\left(90^{\circ}-\frac{1}{2}\right.C\right)};$$

and the second side becomes

$$-\tan\frac{1}{2}(\frac{1}{2}A+\frac{1}{2}B+90^{\circ}-\frac{1}{2}C)\tan\frac{1}{2}(\frac{1}{2}A+\frac{1}{2}B-90^{\circ}+\frac{1}{2}C);$$
 or,

$$-\tan \frac{1}{4}(A+B-C+180^{\circ})\tan \frac{1}{4}(A+B+C-180^{\circ}).$$

If we remember that $E=A+B+C-180^{\circ}$, and observe that

$$\begin{aligned} \tan \frac{1}{4} (A + B - C + 180^{\circ}) &= \tan \frac{1}{4} (360^{\circ} - 2C + A + B + C - 180^{\circ}) \\ &= \tan \frac{1}{4} (360^{\circ} - 2C + E) \\ &= \tan \left[90^{\circ} - \frac{1}{4} (2C - E) \right] \\ &= \cot \frac{1}{4} (2C - E), \end{aligned}$$

it will be evident that equation (b) may be written

$$\frac{\cos\frac{1}{2}(A+B)-\cos(90^{\circ}-\frac{1}{2}C)}{\cos\frac{1}{2}(A+B)+\cos(90^{\circ}-\frac{1}{2}C)} = -\cot\frac{1}{4}(2C-E)\tan\frac{1}{4}E. \text{ (c)}$$

If we substitute, in equation (b), for A and B, the values $\frac{1}{2}(a+b)$ and $\frac{1}{2}c$, and also substitute s for $\frac{1}{2}(a+b+c)$ and s-c for $\frac{1}{2}(a+b-c)$, equation (b) will become

$$\frac{\cos \frac{1}{2} (a+b) - \cos \frac{1}{2} c}{\cos \frac{1}{2} (a+b) + \cos \frac{1}{2} c} = -\tan \frac{1}{2} s \tan \frac{1}{2} (s-c).$$
 (d)

Comparing (a), (c), and (d), we obtain

$$\cot \frac{1}{4} (2 C - E) \tan \frac{1}{4} E = \tan \frac{1}{2} s \tan \frac{1}{2} (s - c).$$
 (e)

By beginning with the second equation of [49], and treating it in the same way, we obtain as the result,

$$\tan \frac{1}{4} (2 C - E) \tan \frac{1}{4} E = \tan \frac{1}{2} (s - a) \tan \frac{1}{2} (s - b).$$
 (f)

By taking the product of (e) and (f), we obtain the elegant formula,

 $\tan^2 \frac{1}{4} \mathbf{E} = \tan \frac{1}{2} \operatorname{stan} \frac{1}{2} (\mathbf{s} - \mathbf{a}) \tan \frac{1}{2} (\mathbf{s} - \mathbf{b}) \tan \frac{1}{2} (\mathbf{s} - \mathbf{c}),$ [52] which is known as l'Huilier's Formula.

By means of it E may be computed from the three sides, and then the area of the triangle may be found by $\lceil 51 \rceil$.

III. In all other cases, the area may be found by first solving the triangle so far as to obtain the angles or the sides, whichever may be more convenient, and then applying [51] or [52].

Example 1.
$$A = 102^{\circ} 14' 12''$$
 $\log R^2 = \log R^2$. $\log E = 5.37501$ $C = \frac{89^{\circ} 5' 46''}{245^{\circ} 52' 22''}$ $E = 65^{\circ} 52' 22''$ $= 237142''$ $180^{\circ} = 648000''$ $\log F = \frac{1.1497}{120} R^2$

If, therefore, we know the radius of the sphere, we can express the area of a spherical triangle in the ordinary units of area.

* See Wentworth & Hill's Tables, page 20.

```
Example 2. a = 133^{\circ} 26' 19''
                                                                                          \frac{1}{2} s = 85° 37′ 44″
                            b = 64^{\circ} 50' 53''
                                                                                 \frac{1}{2}(s-a) = 18^{\circ} 54' 35''
                                                                                \frac{1}{2}(s-b) = 53^{\circ}12'18''
                           c = 144^{\circ}\,13^{\prime}\,45^{\prime\prime}
                          2s = 342^{\circ}30'57''
                                                                                \frac{1}{2} (s - c) = 13° 30′ 52″
                           s = 171^{\circ} 15' 28.5''
                                                                              \log \tan \frac{1}{2} s = 1.11669
                                                                    log tan \frac{1}{2}(s-a) = 9.53474
log tan \frac{1}{2}(s-b) = 0.12612
log tan \frac{1}{2}(s-c) = 9.38083
                     s - a = 37^{\circ}49' 9.5''

                     s-c = 27^{\circ} 1'43.5''
                                                                            \log \tan^2 \frac{1}{4} E = 0.15838
                                                                            \log \tan \frac{1}{4} E = 0.07919
                                                                                       \frac{1}{4}E = 50^{\circ}11'43''
                                                                                            E = 200^{\circ}\,46'\,52''
```

EXERCISE XLI.

- 1. Given $A=84^{\circ}\,20'\,19''$, $B=27^{\circ}\,22'\,40''$, $C=75^{\circ}\,33'$; find E=26159'', $F=0.12682\,R^2$.
- 2. Given $a=69^{\circ}\,15'\,6''$, $b=120^{\circ}\,42'\,47''$, $c=159^{\circ}\,18'\,33''$; find $E=216^{\circ}\,40'\,28''$.
- 3. Given $a=33^{\circ}$ 1' 45", $b=155^{\circ}$ 5' 18", $C=110^{\circ}$ 10'; find $E=133^{\circ}$ 48' 53".
- 4. Find the area of a triangle on the earth's surface (regarded as spherical), if each side of the triangle is equal to 1°. (Radius of earth = 3958 miles.)

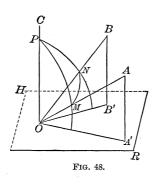

CHAPTER IX.

APPLICATIONS OF SPHERICAL TRIGONOMETRY.

§ 63. Problem.

To reduce an angle measured in space to the horizon.

Let O (Fig. 48) be the position of the observer on the ground,

AOB = h, the angle measured in space, (for example, the angle between the tops of two church spires), OA' and OB' the projections of the sides of the angle upon the horizontal plane HR, AOA' = m and BOB' = n, the angles of inclination of OA and OB respectively to the horizon. Required the angle A'OB' = x made by the projections on the horizon.

The planes of the angles of inclination AOA' and BOB' produced intersect in the line OC, which is perpendicular to the horizontal plane (Geom. § 520).

From O as a centre describe a sphere, and let its surface cut the edges of the trihedral angle O-ABC in the points M, N, and P. In the spherical triangle MNP the three sides MN = h, $MP = 90^{\circ} - m$, $NP = 90^{\circ} - n$, are known, and the spherical angle P is equal to the required angle x.

From § 48 we obtain

 $\cos \frac{1}{2} x = \sqrt{\cos s \cos (s - h) \sec m \sec n},$ where $\frac{1}{2} (m + n + h) = s$.

§ 64. Problem.

To find the distance between two places on the earth's surface (regarded as spherical), given the latitudes of the places and the difference of their longitudes.

Let M and N (Fig. 49) be the places; then their distance

MN is an arc of the great circle passing through the places. Let P be the pole, AB the equator. The arcs MR and NS are the latitudes of the places, and the arc RS, or the angle MPN, is the difference of their longitudes. Let MR = a, NS = b, RS = l; then in the spherical triangle MNP two sides, $MP = 90^{\circ} - a$, $NP = 90^{\circ} - b$, and the

included angle MPN = l, are given, and we have (from § 56)

$$\tan m = \cot a \cos l,$$

 $\cos MN = \sin a \sec m \sin (b + m).$

From these equations first find m, then the arc MN, and then reduce MN to geographical miles, of which there are 60 in each degree.

§ 65. The Celestial Sphere.

The Celestial Sphere is an imaginary sphere of indefinite radius, upon the concave surface of which all the heavenly bodies appear to be situated.

The Celestial Equator, or Equinoctial, is the great circle in which the plane of the earth's equator produced intersects the surface of the celestial sphere.

The **Poles** of the equinoctial are the points where the earth's axis produced cuts the surface of the celestial sphere.

The **Celestial Meridian** of an observer is the great circle in which the plane of his terrestrial meridian produced meets the surface of the celestial sphere.

Hour Circles, or Circles of Declination, are great circles passing through the poles, and perpendicular to the equinoctial.

The **Horizon** of an observer is the great circle in which a plane tangent to the earth's surface, at the place where he is, meets the surface of the celestial sphere.

The **Zenith** of an observer is that pole of his horizon which is exactly above his head.

Vertical Circles are great circles passing through the zenith of an observer, and perpendicular to his horizon.

The vertical circle passing through the east and west points of the horizon is called the **Prime Vertical**; that passing through the north and south points coincides with the celestial meridian.

The **Ecliptic** is a great circle of the celestial sphere, apparently traversed by the sun in one year from west to east, in consequence of the motion of the earth around the sun.

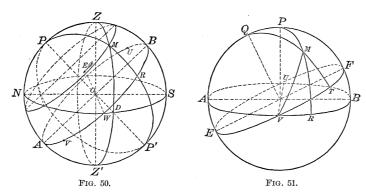

The **Equinoxes** are the points where the ecliptic cuts the equinoctial. They are distinguished as the *Vernal* equinox and the *Autumnal* equinox; the sun in his annual journey passes through the former on March 21, and through the latter on September 21.

Circles of Latitude are great circles passing through the poles of the ecliptic, and perpendicular to the plane of the ecliptic.

The angle which the ecliptic makes with the equinoctial is called the **obliquity** of the ecliptic; it is equal to 23° 27′, nearly, and is often denoted by the letter e.

These definitions are illustrated in Figs. 50 and 51. In Fig. 50, AVBU is the equinoctial, P and P' its poles, NPZS the celestial meridian of an observer, NESW his horizon, Z his zenith, M a star, PMP' the hour circle passing through the star, ZMDZ the vertical through the star.

In Fig. 51, AVBU represents the equinoctial, EVFU the ecliptic, P and Q their respective poles, V the vernal equinox, U the autumnal equinox, M a star, PMR the hour circle through the star, QMT the circle of latitude through the star, and $\angle TVR = e$.

The earth's diurnal motion causes all the heavenly bodies to appear to rotate from east to west at the uniform rate of 15° per hour. If in Fig. 50 we conceive the observer placed at the centre O, and his zenith, horizon, and celestial meridian fixed in position, and all the heavenly bodies rotating around PP' as an axis from east to west at the rate of 15° per hour, we form a correct idea of the apparent diurnal motions of these bodies. When the sun or a star in its diurnal motion crosses the meridian, it is said to make a transit across the meridian; when it passes across the part NWS of the horizon, it is said to set; and when it passes across the part NES, it is said to rise (the effect of refraction being here neglected). Each star, as M, describes daily a small circle of the sphere parallel to the equinoctial, and called the Diurnal Circle of the star. The nearer the star is to the pole the smaller is the diurnal circle; and if there were stars at the poles P and P', they would have no diurnal motion. To an observer north of the equator, the north pole P is *elevated* above the horizon (as shown in Fig. 50); to an observer south of the equator, the south pole P' is the elevated pole.

§ 66. Spherical Co-ordinates.

Several systems of fixing the position of a star on the surface of the celestial sphere at any instant are in use. In each system a great circle and its pole are taken as standards of reference, and the position of the star is determined by means of two quantities called its *spherical co-ordinates*.

I. If the horizon and the zenith are chosen, the co-ordinates of the star are called its altitude and its azimuth.

The Altitude of a star is its angular distance, measured on a vertical circle, above the horizon. The complement of the altitude is called the Zenith Distance.

The Azimuth of a star is the angle at the zenith formed by the meridian of the observer and the vertical circle passing through the star, and is measured therefore by an arc of the horizon. It is usually reckoned from the north point of the horizon in north latitudes, and from the south point in south latitudes; and east or west according as the star is east or west of the meridian.

II. If the equinoctial and its pole are chosen, then the position of the star may be fixed by means of its declination and its hour angle.

The **Declination** of a star is its angular distance from the equinoctial, measured on an hour circle. The angular distance of the star, measured on the hour circle, from the elevated pole, is called its **Polar Distance**.

The declination of a star, like the latitude of a place on the earth's surface, may be either north or south; but, in practical problems, while latitude is always to be considered positive, declination, if of a different name from the latitude, must be regarded as *negative*.

If the declination is negative, the polar distance is equal numerically to 90° + the declination.

The Hour Angle of a star is the angle at the pole formed by the meridian of the observer and the hour circle passing through the star. On account of the diurnal rotation, it is constantly changing at the rate of 15° per hour. Hour angles are reckoned from the celestial meridian, positive towards the west, and negative towards the east.

III. The equinoctial and its pole being still retained, we may employ as the co-ordinates of the star its declination and its right ascension.

The **Right Ascension** of a star is the arc of the equinoctial included between the vernal equinox and the point where the hour circle of the star cuts the equinoctial. Right ascension is reckoned from the vernal equinox eastward from 0° to 360°.

IV. The ecliptic and its pole may be taken as the standards of reference. The co-ordinates of the star are then called its latitude and its longitude.

The Latitude of a star is its angular distance from the ecliptic measured on a circle of latitude.

The **Longitude** of a star is the arc of the ecliptic included between the vernal equinox and the point where the circle of latitude through the star cuts the ecliptic.

For the star M (Fig. 50),

```
let l = latitude of the observer,

h = DM = the altitude of the star,

z = ZM = the zenith distance of the star,

a = \angle PZM = the azimuth of the star,

t = \angle ZPM = the hour angle of the star,

d = RM = the declination of the star,

p = PM = the polar distance of the star,

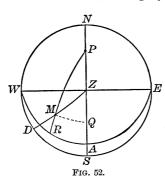

r = VR = the right ascension of the star,

u = MT (Fig. 51) = the latitude of the star,

v = VT (Fig. 51) = the longitude of the star.
```

In many problems, a simple way of representing the magnitudes involved, is to project the sphere on the plane of the

NESW is the horizon, Z the zenith, NZS the meridian, WZE the prime vertical, WAE the equinoctial projected on the plane of the horizon, P the elevated pole, M a star, DM its altitude, ZM its zenith distance, $\angle PZM$ its azimuth, MR its declination, PM its polar distance, $\angle ZPM$ its hour angle.

§ 67. THE ASTRONOMICAL TRIANGLE.

The triangle *ZPM* (Figs. 50 and 52) is often called the *astronomical triangle*, on account of its importance in problems in Nautical Astronomy.

The side PZ is equal to the complement of the latitude of the observer. For (Fig. 50) the angle ZOB between the zenith of the observer and the celestial equator is obviously equal to his latitude, and the angle POZ is the complement of ZOB. The arc NP being the complement of PZ, it follows that the altitude of the elevated pole is equal to the latitude of the place of observation.

The triangle ZPM then (however much it may vary in shape for different positions of the star M) always contains the following five magnitudes:

PZ = co-latitude of observer = $90^{\circ}-l$, ZM = zenith distance of star = z, PZM = azimuth of star = a, PM = polar distance of star = p, ZPM = hour angle of star = t.

A very simple relation exists between the hour angle of the sun and the local (apparent) time of day. Since the hourly rate at which the sun appears to move from east to west is 15°, and it is apparent noon when the sun is on the meridian of a place, it is evident that if hour angle = 0°, 15°, -15°, etc., time of day is noon, 1 o'clock P.M., 11 o'clock A.M., etc.

In general, if t denote the absolute value of the hour angle,

time of day =
$$\frac{t}{15}$$
 P.M., or $12 - \frac{t}{15}$ A.M.,

according as the sun is west or east of the meridian.

§ 68. Problem.

Given the latitude of the observer and the altitude and azimuth of a star, to find its declination and its hour angle.

In the triangle ZPM (Fig. 52),

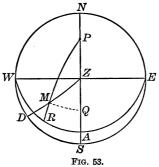

```
PZ = 90^{\circ} - l = \text{co-latitude}
given
                      ZM = 90^{\circ} - h = \text{co-altitude}
                 \angle PZM = a
                                       = azimuth,
                     PM = 90^{\circ} - d = \text{polar distance}
to find
                 \angle ZPM = t
                                       = hour angle.
   Draw
                     MQ \perp \text{to } NS, and put ZQ = m,
                     a < 90^{\circ}, PQ = 90^{\circ} - (l + m),
then, if
                     a > 90^{\circ}, PQ = 90^{\circ} - (l - m);
and if
and, by Napier's Rules,
                    \cos a = \pm \tan m \tan h,
                    \sin d = \cos PQ \cos MQ
                    \sin h = \cos m \cos MQ;
whence,
                    \tan m = \pm \cot h \cos a,
                    \sin d = \sin h \sin (l \pm m) \sec m,
in which the — sign is to be used if a > 90^{\circ}. The hour angle
```

may then be found by means of [44], whence we have

 $\sin t = \sin a \cos h \sec d$.

§ 69. Problem.

To find the hour angle of a heavenly body when its declination, its altitude, and the latitude of the place are known.

In the triangle ZPM (Fig. 53),

given
$$PZ = 90^{\circ} - l$$
,
 $PM = 90^{\circ} - d = p$,
 $ZM = 90^{\circ} - h$;

required

$$\angle ZPM = t$$
.

If, in the first formula of [47],

$$\sin \frac{1}{2}A = \sqrt{\sin (s-b)\sin (s-c)\csc b\csc c},$$

we put

$$A = t$$
, $a = 90^{\circ} - h$, $b = p$, $c = 90^{\circ} - l$,

we have

$$s-b=90^{\circ}-\frac{1}{2}(l+p+h), \quad s-c=\frac{1}{2}(l+p-h),$$

and the formula becomes

$$\sin \frac{1}{2}t = \pm \left[\cos \frac{1}{2}(l+p+h)\sin \frac{1}{2}(l+p-h)\sec l\csc p\right]^{\frac{1}{2}},$$

in which the — sign is to be taken when the body is east of the meridian.

If the body is the sun, how can the local time be found when the hour angle has been computed? (See § 67.)

§ 70. Problem.

To find the altitude and azimuth of a celestial body, when its declination, its hour angle, and the latitude of the place are known.

In the triangle ZPM (Fig. 53), given $PZ = 90^{\circ} - l,$ $PM = 90^{\circ} - d = p,$ $\angle ZPM = t;$ required $ZM = 90^{\circ} - h,$ $\angle PZM = a.$

Here there are given two sides and the included angle. Placing PQ = m, and proceeding as in § 68, we obtain

$$\tan m = \cot d \cos t,$$

$$\sin h = \sin (l+m) \sin d \sec m,$$

$$\tan a = \sec (l+m) \tan t \sin m,$$

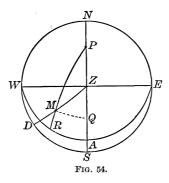

in the last of which formulas a must be marked E. or W., to agree with the hour angle.

§ 71. Problem.

To find the latitude of the place when the altitude of a celestial body, its declination, and its hour angle are known.

In the triangle ZPM (Fig. 53), given $ZM=90^{\circ}-h$, $PM=90^{\circ}-d$, $\angle ZPM=t$; required $PZ=90^{\circ}-l$. Let $PQ=m,\ ZQ=n$.

Then, by Napier's Rules,

$$\cos t = \tan m \tan d,$$

 $\sin h = \cos n \cos MQ,$
 $\sin d = \cos m \cos MQ;$

whence,

$$\tan m = \cot d \cos t,$$

$$\cos n = \cos m \sin h \csc d,$$

and it is evident from the figure that

$$l = 90^{\circ} - (m \pm n),$$

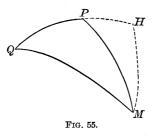

in which the sign + or the sign - is to be taken according as

the body and the elevated pole are on the same side of the prime vertical or on opposite sides.

In fact, both values of l may be possible for the same altitude and hour angle; but, unless n is very small, the two values will differ largely from each other, so that the observer has no difficulty in deciding which of them should be taken.

§ 72. Problem.

Given the declination, the right ascension of a star, and the

obliquity of the ecliptic, to find the latitude and the longitude of the

Let M (Fig. 55) be the star, P be the pole of the equinoctial, and Q the pole of the ecliptic.

Then, in the triangle PMQ,

given
$$PQ=e=23^{\circ}27'$$
,

$$PM = 90^{\circ} - d,$$

 $\angle MPQ = 90^{\circ} + r \text{ (see Fig. 51)};$

required
$$QM = 90^{\circ} - u$$
 and $\angle PQM = 90^{\circ} - v$ (see Fig. 51).

In this case, also, two sides and the included angle are given. Draw $MH \perp$ to PQ, and meeting it produced at H, and let PH = n.

By Napier's Rules,

 $\sin r = \tan n \tan d,$ $\sin u = \cos (e + n) \cos MH,$ $\sin d = \cos n \cos MH,$ $\sin (e + n) = \tan v \tan MH,$ $\sin n = \tan r \tan MH;$ $\tan n = \cot d \sin r,$ $\sin u = \sin d \cos (e + n) \sec n,$ $\tan v = \tan r \sin (e + n) \csc n.$

To avoid obtaining u from its sine we may proceed as follows:

From the last two equations we have, by division,

$$\sin u = \tan v \cot (e + n) \sin d \cot r \tan n.$$

By taking MH as middle part, successively, in the triangles MQH and MPH, we obtain

 $\cos u \cos v = \cos d \cos r;$

whence,

whence,

 $\cos u = \sec v \cos d \cos r$.

From these values of $\sin u$ and $\cos u$ we obtain, by division,

$$\tan u = \sin v \cot (e + n) \tan d \csc r \tan n$$
.

From the relation

 $\sin r = \tan n \tan d$,

it follows that $\tan d \csc r \tan n = 1$.

Therefore $\tan u = \sin v \cot (e + n)$,

a formula by which u can be easily found after v has been computed.

EXERCISE XLII.

- 1. Find the dihedral angle made by adjacent lateral faces of a regular ten-sided pyramid; given the angle $V=18^{\circ}$, made at the vertex by two adjacent lateral edges.
- 2. Through the foot of a rod which makes the angle A with a plane, a straight line is drawn in the plane. This line makes the angle B with the projection of the rod upon the plane. What angle does this line make with the rod?
- 3. Find the volume V of an oblique parallelopipedon; given the three unequal edges a, b, c, and the three angles l, m, n, which the edges make with one another.
- 4. The continent of Asia has nearly the shape of an equilateral triangle, the vertices being the East Cape, Cape Romania, and the Promontory of Baba. Assuming each side of this triangle to be 4800 geographical miles, and the earth's radius to be 3440 geographical miles, find the area of the triangle: (i.) regarded as a plane triangle; (ii.) regarded as a spherical triangle.
- 5. A ship sails from a harbor in latitude l, and keeps on the arc of a great circle. Her *course* (or angle between the direction in which she sails and the meridian) at starting is a. Find where she will cross the equator, her course at the equator, and the distance she has sailed.
- 6. Two places have the same latitude l, and their distance apart, measured on an arc of a great circle, is d. How much greater is the arc of the parallel of latitude between the places than the arc of the great circle? Compute the results for $l=45^{\circ}$, $d=90^{\circ}$.
- 7. The shortest distance d between two places and their latitudes l and l' are known. Find the difference between their longitudes.

- 8. Given the latitudes and longitudes of three places on the earth's surface, and also the radius of the earth; show how to find the area of the spherical triangle formed by arcs of great circles passing through the places.
- 9. The distance between Paris and Berlin (that is, the arc of a great circle between these places) is equal to 472 geographical miles. The latitude of Paris is 48° 50′ 13″; that of Berlin, 52° 30′ 16″. When it is noon at Paris what time is it at Berlin?

Note. Owing to the apparent motion of the sun, the local time over the earth's surface at any instant varies at the rate of one hour for 15° of longitude; and the more *easterly* the place, the *later* the local time.

- 10. The altitude of the pole being 45°, I see a star on the horizon and observe its azimuth to be 45°; find its polar distance.
- 11. Given the latitude l of the observer, and the declination d of the sun; find the local time (apparent solar time) of sunrise and sunset, and also the azimuth of the sun at these times (refraction being neglected). When and where does the sun rise on the longest day of the year (at which time $d=+23^{\circ}\ 27'$) in Boston ($l=42^{\circ}\ 21'$), and what is the length of the day from sunrise to sunset? Also, find when and where the sun rises in Boston on the shortest day of the year (when $d=-23^{\circ}\ 27'$), and the length of this day.
- 12. When is the solution of the problem in Example 11 impossible, and for what places is the solution impossible?
- 13. Given the latitude of a place and the sun's declination; find his altitude and azimuth at 6 o'clock A.M. (neglecting refraction). Compute the results for the longest day of the year at Munich $(l=48^{\circ}9')$.
- 14. How does the altitude of the sun at 6 A.M. on a given day change as we go from the equator to the pole? At what

time of the year is it a maximum at a given place? (Given $\sin h = \sin l \sin d$.)

- 15. Given the latitude of a place north of the equator, and the declination of the sun; find the time of day when the sun bears due east and due west. Compute the results for the longest day at St. Petersburg $(l = 59^{\circ} 56')$.
- 16. Apply the general result in Example 15 ($\cos t = \cot l \tan d$) to the case when the days and nights are equal in length (that is, when $d=0^{\circ}$). Why can the sun in summer never be due east before 6 A.M., or due west after 6 P.M.? How does the time of bearing due east and due west change with the declination of the sun? Apply the general result to the cases where l < d and l = d. What does it become at the north pole?
- 17. Given the sun's declination and his altitude when he bears due east; find the latitude of the observer.
- 18. At a point O in a horizontal plane MN a staff OA is fixed, so that its angle of inclination AOB with the plane is equal to the latitude of the place, 51° 30' N., and the direction OB is due north. What angle will OB make with the shadow of OA on the plane, at 1 P.M., when the sun is on the equinoctial?
- 19. What is the direction of a wall in latitude 52° 30′ N. which casts no shadow at 6 A.M. on the longest day of the year?
- 20. At a certain place the sun is observed to rise exactly in the north-east point on the longest day of the year; find the latitude of the place.
- 21. Find the latitude of the place at which the sun sets at 10 o'clock on the longest day.
- 22. To what does the general formula for the hour angle, in § 69, reduce when (i.) $h = 0^{\circ}$, (ii.) $l = 0^{\circ}$ and $d = 0^{\circ}$, (iii.) l or $d = 90^{\circ}$?

- 23. What does the general formula for the azimuth of a celestial body, in § 70, become when $t = 90^{\circ} = 6$ hours?
- 24. Show that the formulas of § 71, if $t = 90^{\circ}$, lead to the equation $\sin l = \sin h \csc d$; and that if $d = 0^{\circ}$, they lead to the equation $\cos l = \sin h \sec t$.
- 25. Given latitude of place 52° 30′ 16″, declination of star 38°, its hour angle 28° 17′ 15″; find its altitude.
- 26. Given latitude of place $51^{\circ} 19' 20''$, polar distance of star $67^{\circ} 59' 5''$, its hour angle $15^{\circ} 8' 12''$; find its altitude and its azimuth.
- 27. Given the declination of a star 7° 54′, its altitude 22° 45′ 12″, its azimuth 129° 45′ 37″; find its hour angle and the latitude of the observer.
- 28. Given the longitude v of the sun, and the obliquity of the ecliptic $e=23^{\circ}\ 27'$; find the declination d, and the right ascension r.
- 29. Given the obliquity of the ecliptic $e=23^{\circ}$ 27', the latitude of a star 51°, its longitude 315°; find its declination and its right ascension.
- 30. Given the latitude of place 44° 50′ 14″, the azimuth of a star 138° 58′ 43″, and its hour angle 20°; find its declination.
- 31. Given latitude of place 51° 31′ 48″, altitude of sun west of the meridian 35° 14′ 27″, its declination $+21^{\circ}$ 27′; find the local apparent time.
- 32. Given the latitude of a place l, the polar distance p of a star, and its altitude h; find its azimuth a.

APPENDIX.

FORMULAS.

PLANE TRIGONOMETRY.

1.
$$\sin^2 A + \cos^2 A = 1$$
.
2. $\tan A = \frac{\sin A}{\cos A}$.
 $\begin{cases} \sin A \times \csc A = 1 \\ \cos A \times \sec A = 1 \end{cases}$.
4. $\sin (x + y) = \sin x \cos y + \cos x \sin y$.
5. $\cos (x + y) = \cos x \cos y - \sin x \sin y$.
6. $\tan (x + y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}$.
7. $\cot (x + y) = \frac{\cot x \cot y - 1}{\cot y + \cot x}$.
8. $\sin (x - y) = \sin x \cos y - \cos x \sin y$.
9. $\cos (x - y) = \cos x \cos y + \sin x \sin y$.
10. $\tan (x - y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}$.
11. $\cot (x - y) = \frac{\cot x \cot y + 1}{\cot y - \cot x}$.
12. $\sin 2x = 2 \sin x \cos x$.
13. $\cos 2x = \cos^2 x - \sin^2 x$.

$$\begin{cases} \sin\frac{1}{2}a = \sqrt{-\cos S\cos(S-A)\csc B\csc C}. \end{cases}$$

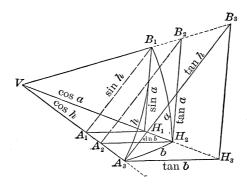

48.
$$\begin{cases} \sin\frac{1}{2}a = \sqrt{-\cos S\cos(S-A)\csc B\csc C}, \\ \cos\frac{1}{2}a = \sqrt{\cos(S-B)\cos(S-C)\csc B\csc C}, \\ \tan\frac{1}{2}a = \sqrt{-\cos S\cos(S-A)\sec(S-B)\sec(S-C)}. \end{cases}$$

$$49. \begin{cases} \cos\frac{1}{2}(A+B)\cos\frac{1}{2}c = \cos\frac{1}{2}(a+b)\sin\frac{1}{2}C.\\ \sin\frac{1}{2}(A+B)\cos\frac{1}{2}c = \cos\frac{1}{2}(a-b)\cos\frac{1}{2}C.\\ \cos\frac{1}{2}(A-B)\sin\frac{1}{2}c = \sin\frac{1}{2}(a+b)\sin\frac{1}{2}C.\\ \sin\frac{1}{2}(A-B)\sin\frac{1}{2}c = \sin\frac{1}{2}(a-b)\cos\frac{1}{2}C. \end{cases}$$

$$\begin{cases}
\tan \frac{1}{2}(A+B) = \frac{\cos \frac{1}{2}(a-b)}{\cos \frac{1}{2}(a+b)} \cot \frac{1}{2}C. \\
\tan \frac{1}{2}(A-B) = \frac{\sin \frac{1}{2}(a-b)}{\sin \frac{1}{2}(a+b)} \cot \frac{1}{2}C. \\
\tan \frac{1}{2}(a+b) = \frac{\cos \frac{1}{2}(A-B)}{\cos \frac{1}{2}(A+B)} \tan \frac{1}{2}c. \\
\tan \frac{1}{2}(a-b) = \frac{\sin \frac{1}{2}(A-B)}{\sin \frac{1}{2}(A+B)} \tan \frac{1}{2}c.
\end{cases}$$

51.
$$F = \frac{\pi R^2 E}{180}$$
.
52. $\tan^2 \frac{1}{4} E = \tan \frac{1}{2} s \tan \frac{1}{2} (s-a) \tan \frac{1}{2} (s-b) \tan \frac{1}{2} (s-c)$.

PROF. BLAKSLEE's construction by which the direction ratios for plane right triangles give directly from a figure the analogies for a right trihedral or for a right spherical triangle.

The construction consists of two parts.

- (a) Lay off from the vertex V a unit's distance on each edge.
- (b) Pass through the three extremities of these distances three planes perpendicular to one of the edges, as VA. Now these three parallel planes will cut out three similar right triangles. The first being constructed in either of the two usual ways, the construction of the others is evident.

Since the plane angles A_1 , A_2 , A_3 all equal the dihedral A, and the nine right triangles in the three faces give the values in the figure, we have:

- (1) $\sin A = \sin a : \sin h$; similarly, $\sin B = \sin b : \sin h$.
- (2) $\cos A = \tan b : \tan h$; similarly, $\cos B = \tan \alpha : \tan h$.
- (3) $\tan A = \tan a : \sin b$; similarly, $\tan B = \tan b : \sin a$.
- (4) $\cos h = \cos a : \cos b$; (by 3) = $\cot A \cot B$.
- (5) $\sin A = \cos B : \cos b ; \sin B = \cos A : \cos a$.

Note. If a sphere of unit radius be described about V as a centre, the three faces will cut out a right spherical triangle, having the sides a, b, and h, and angles A, B, and H. The above formulas are thus seen to be the analogies of:

- (1) $\sin A = a : h$; $\sin B = b : h$.
- (2) $\cos A = b : h ; \cos B = a : h$.
- (3) $\tan A = a : b ; \tan B = b : a$.
- (4) $h^2 = a^2 + b^2$; $1 = \sin^2 + \cos^2$; $1 = \cot A \cot B$.

FORMULAS.

(5) $\sin A = \cos B$; $\sin B = \cos A$.

Napier's rules give only the following, which follow from the analogies as numbered:

- By $\begin{cases} \sin a = \sin A \sin h = \tan b \cot B \\ \sin b = \sin B \sin h = \tan a \cot A \end{cases}$ (3)
- (5) $\begin{cases} \cos A = \sin B \cos a = \tan b \cot h \\ \cos B = \sin A \cos b = \tan a \cot h \end{cases}$ (2)
- (4) $\begin{cases} \cos h = \cos a \cos b = \cot A \cot B \end{cases}$ (4)

THE GAUSS EQUATIONS.

- $\cos \frac{1}{2} (A + B) \cos \frac{1}{2} c = \cos \frac{1}{2} (a + b) \sin \frac{1}{2} C.$
- $\sin \frac{1}{2} (A + B) \cos \frac{1}{2} c = \cos \frac{1}{2} (a b) \cos \frac{1}{2} C.$
- $\cos \frac{1}{2} (A B) \sin \frac{1}{2} c = \sin \frac{1}{2} (a + b) \sin \frac{1}{2} C.$
- $\sin \frac{1}{2} (A B) \sin \frac{1}{2} c = \sin \frac{1}{2} (a b) \cos \frac{1}{2} C.$
- $f_{\frac{1}{2}}(A \pm B)$ $f_{\frac{1}{2}}c = f_{\frac{1}{2}}(a \pm b)$ $f_{\frac{1}{2}}c$.
- Rule I. \sin in (I.) gives in (3), and conversely. cos in (I.) gives + in (3), and conversely.
- Rule II. Functions have same names in (2) and (3).

Functions have co-names in (4) and (1).

SURVEYING.

CHAPTER I.

DEFINITIONS. INSTRUMENTS AND THEIR USES.

§ 1. Definitions.

Surveying is the art of determining and representing distances, areas, and the relative position of points upon the surface of the earth.

In plane surveying, the portion surveyed is considered as a plane.

In geodetic surveying, the curvature of the earth is regarded.

- A Plumb-Line is a cord with a weight attached and freely suspended.
- A Vertical Line is a line having the direction of the plumbline.
 - A Vertical Plane is a plane embracing a vertical line.
- A Horizontal Plane is a plane perpendicular to a vertical line.
 - A Horizontal Line is a line in a horizontal plane.
- A Horizontal Angle is an angle the sides of which are in a horizontal plane.
- A Vertical Angle is an angle the sides of which are in a vertical plane. If one side of a vertical angle is horizontal, and the other ascends, it is an angle of elevation; if one side is horizontal, and the other descends, it is an angle of depression.

The Magnetic Meridian is the direction which a bar-magnet assumes when freely supported in a horizontal position.

The Magnetic Bearing of a line is the angle it makes with the magnetic meridian.

Surveying commonly comprises three distinct operations; viz.:

- 1. The **Field Measurements**, or the process of determining by direct measurement certain lines and angles.
- 2. The **Computation** of the required parts from the measured lines and angles.
- 3. The **Plotting**, or representing on paper the measured and computed parts in relative extent and position.

THE MEASUREMENT OF LINES.

§ 2. Instruments for Measuring Lines.

The Gunter's Chain is generally employed in measuring land. It is 4 rods, or 66 feet, in length, and is divided into 100 links. Hence, links may be written as hundredths of a chain.

The Engineer's Chain is employed in surveying railroads, canals, etc. It is 100 feet long, and is divided into 100 links.

A Tape Measure, divided into feet and inches, is employed in measuring town-lots, cross-section work in railroad surveying, etc.

In the United States Coast and Geodetic Survey, the meter is the unit; and, when great accuracy is required, **rods** placed end to end, and brought to a horizontal position by means of a spirit-level, are employed in measuring lines.

§ 3. Chaining.

Eleven tally-pins of iron or steel are used in chaining; also, one or more iron-shod poles called flag-staffs or range poles.

A forward chainman, or leader, and a hind chainman, or follower, are required. A flag-staff having been placed at the farther end of the line, or at some point in the line visible CHAINING. 195

from the beginning, the follower takes one end of the chain, and a pin which he thrusts into the ground at the beginning of the line. The leader moves forward in the direction of the flag-staff, with the other end of the chain and the remaining ten pins, until the word "halt" from the follower warns him that he has advanced nearly the length of the chain.

At this signal he stops, and the follower, meanwhile having placed his end of the chain at the beginning of the line, directs the leader by the words "right" or "left" until the chain is exactly in line with the flag-staff. This being accomplished, and the chain stretched tightly in a horizontal position, the follower says, "down." The leader then puts in a tally-pin exactly at the end of the chain, and answers, "down"; after which the follower withdraws the pin at the beginning of the line, and the chainmen move forward until the follower nears the pin set by the leader. The follower again says, "halt," and the operation just described is repeated. This process is continued until the end of the line is reached.

If the tally-pins in the hands of the leader are exhausted before the end of the line is reached, when he has placed the last pin in the ground, he waits until the follower comes up to him. The follower gives the leader the ten pins in his hand, and records the fact that ten chains have been measured. The measuring then proceeds as before. If the distance from the last pin to the end of the line is less than a chain, the leader places his end of the chain at the end of the line, and the follower stretches tightly such a part of the chain as is necessary to reach to the last pin, and the number of links is counted. The number of whole chains is indicated by the number of pins in the hands of the follower, the last pin remaining in the ground.

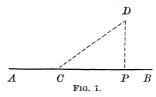

In measuring, the chain must be held in a horizontal position. If the ground slopes, one end of the chain must be raised until the horizontal position is attained. By means of

a plumb-line, or a slender staff, or, less accurately, by dropping a pin (heavy end downwards), the point vertically under the raised end of the chain may be determined. If the slope is considerable, half a chain or less may be used.

To construct a perpendicular with a chain:

1. When the point through which the perpendicular is to pass is in the line:

Let AB (Fig. 1) represent the line, and P the point. Measure from

P to the right or left, PC=40 links, and place a stake at C. Let one end of the chain be held at P, and the end of the eightieth link at C; then, taking the chain at the end of the thirtieth link from P, draw it so that the portions DC and DP are tightly stretched, and place a stake at D. DP will be the perpen-

dicular required. (Why?)

2. When the point is without the line:

Let AB (Fig. 1) be the line, and D the point. Take C any point in the line, and stretch the chain between D and C; then, let the middle of the part of the chain between C and D be held in place, and swing the end at D around until it meets the line in P. DP will be the perpendicular required. (Why?)

§ 4. Obstacles to Chaining.

1. When a tree, building, or other obstacle is encountered in measuring or extending a line, it may be passed by an offset in the following manner:

To prolong the line AB' past a building O (Fig. 2). At B erect BE per-

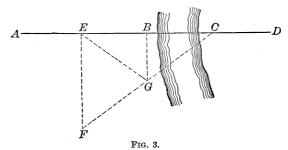

2). At B erect BE perpendicular to AB; at E erect EF perpendicular to BE; at F erect FC = BE perpendicular to

EF; then, CD perpendicular to FC will be in the required line, and AB + EF + CD = AD. By constructing two other perpendiculars, B'E' and F'C', the accuracy of the work will be increased.

2. To measure across a body of water:

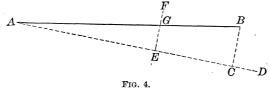

Let it be required to measure the line ABCD (Fig. 3) crossing a river between B and C. Measure BE=400 links; at E erect the perpendicular EF=600 links; at B erect the perpendicular BG=300 links. Place a stake at C, the intersection of AD and FG beyond the river.

Then BC=400 links. For, by similar triangles, EF:BG::CE:CB. But $EF=2\,BG$; hence, $CE=2\,CB$, and CB=BE=400 links. EG and FG should be measured, in order to test the accuracy of the work. EG=FG=500 links.

Instead of the above distances, any convenient distances may be taken. For, if EF = 2 BG, then CB = BE, and $EG = FG = \sqrt{\overline{EB^2 + BG^2}}$.

3. To measure a line the end of which is invisible from the beginning, and intermediate points unknown:

Let AB (Fig. 4) represent the line. Set up a flag-staff at D, beyond B and visible from A. From B let fall BC perpendicular to AD. Measure AC and BC. Then

$$AB = \sqrt{\overline{AC^2 + BC^2}}.$$

To find intermediate points on AB:

At any point E on AC erect EF perpendicular to AC, and determine EG by the proportion AC:CB::AE:EG. G will be a point on AB.

The line AD is called a Random Line.

THE MEASUREMENT OF ANGLES.

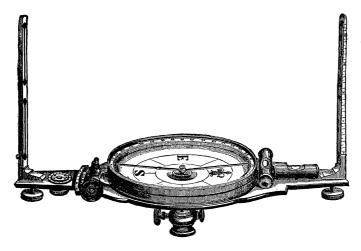

§ 5. The Surveyor's Compass.*

The Surveyor's Compass is shown on the following page.

The compass circle is divided into half-degrees, and is figured from 0° to 90° each way from the north and south points. In the centre of the compass circle is the pivot which supports the magnetic needle. The needle may be lifted from the pivot by a spring and pressed against the glass covering of the compass circle, when the instrument is not in use. The main plate moves around the compass circle through a small arc, read by the vernier, for the purpose of allowing for the variation of the needle (§ 23). The sight standards at the extremities of the main plate have fine slits nearly their whole length, with circular openings at intervals; on the edges of the north standard are tangent scales for reading vertical angles; and on the outside of the south standard are two eye-pieces at the same distance from the main plate as the zeros of the tangent scales, respectively. The telescopic sight (a recent improvement by the Messrs. Gurley), consists of a small telescope attached to the south standard. The main plate is furnished with two spirit levels at right angles, and turns horizontally upon the upper end of the ball spindle, the lower end of which rests in a spherical socket in the top of the tripod or Jacob's staff which supports the instrument. From the centre of the plate at the top of the tripod a plummet is suspended by which the centre of the compass can be placed directly over a definite point on the ground.

*The instruments described on this and the following pages are adjusted by the maker. If they should require readjustment, full directions will be found in the manual furnished with the instruments.

The manual published by Messrs. W. & L. E. Gurler, Troy, N. Y., has been freely used, by permission, in describing these instruments.

THE SURVEYOR'S COMPASS.

Note. The letters E and W on the face of the compass are reversed from their true positions. The reason for this is that if the sights are turned towards the west, the north end of the needle is turned towards the letter W, and if the north end of the needle is turned towards E, the sights are turned towards the east.

If the north end of the needle points exactly towards E or W, the sights will range east or west.

§ 6. Uses of the Compass.

To take the bearing* of a line. Place the instrument so that the plummet will be directly over one end of the line, and level by pressing with the hands on the main plate until the bubbles are brought to the middle of the spirit levels. Turn the south end of the instrument toward you, and sight at the flag-staff at the other end of the line. Read the bearing from the north end of the needle. First, write N. or S. according as the north end of the needle is nearer N. or S. of the compass circle; secondly, write the number of degrees between the north end of the needle and the nearest zero mark; and thirdly, write E. or W. according as the north end of the needle is nearer E. or W. of the compass circle.

In Fig. 5 the bearing would be N. 45° W.

In Fig. 6 the bearing would be S. 45° W.

In Fig. 7 the bearing would be S. 30° E.

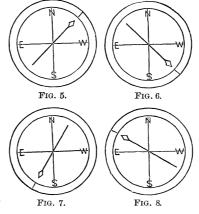

In Fig. 8 the bearing would be N. 60° E.

If the needle coincides with the N.S. or E.W. line, the bear-

ing would be N., S., E., or W., according as the north end of the needle is over N., S., E., or W.

As the compass circle is divided into half-degrees, the bearing may be determined pretty accurately to quarter-degrees.

When a fence or other obstruction interferes with placing the instrument over the line, it may be placed at one side, the flag-staff

being placed at an equal distance from the line.

^{*}The magnetic bearing is meant unless otherwise specified.

Local Disturbances. Before a bearing is recorded, care should be exercised that the chain, pins, and other instruments that would affect the direction of the needle, are removed from the vicinity of the compass. Even after the greatest care in this respect is exercised, the direction of the needle is often affected by iron ore, ferruginous rocks, etc.

Reverse Bearings. When the bearing of a line has been taken, the instrument should be removed to the other end of the line and the reverse bearing taken. The number of degrees should be the same as before, but the letters should be reversed.

To take the bearing of a line one end of which cannot be seen from the other. Run a random line (§ 4, 3); then (Fig. 4),

$$\tan CAB = \frac{BC}{AC};$$

whence the angle *CAB* may be found. This angle combined with the bearing of the random line will give the bearing required.

Another method will be given in § 19.

To measure a horizontal angle by means of the needle. Place the compass over the vertex of the angle, take the bearing of each side separately, and combine these bearings.

To measure angles of elevation. Bring the south end of the compass towards you, place the eye at the lower eye-piece, and with the hand hold a card on the front side of the north sight, so that its top edge will be at right angles to the divided edge and coincide with the zero mark; then, sighting over the top of the card, note upon a flag-staff the height cut by the line of sight; move the staff up the elevation, and carry the card along the edge of the sight until the line of sight again cuts the same height on the staff; read off the degrees of the tangent scale passed over by the card.

To measure angles of depression. Proceed in the same manner as above, using the eye-piece and tangent scale on the opposite sides of the sights, and reading from the top of the sight.

§ 7. Verniers.

First form. Let AB (Fig. 9) represent a portion of a rod for measuring heights (§ 32). The graduation to feet and hundredths of a foot begins at the lower end, which rests on

the ground when the rod is in use. The line extending nearly across the rod at the bottom of the portion shown marks the beginning of the fourth foot. The face of the rod is divided into four columns: in the first is written the number of feet; in the second, the number of tenths; and in the third, the number of hundredths.

It is evident that, with the arrangement just described, heights could be measured only to hundredths of a foot. To enable us to find the height more precisely, a contrivance called a **Vernier** is used. This is shown at the right of the rod. It consists of a piece of metal or wood, the graduated part of which is $\frac{1}{100}$ of a foot in length; and this is divided into ten equal parts. Hence, one division of the vernier $=\frac{1}{10}$ of $\frac{1}{100}=\frac{1}{1000}$ of a foot; and one division of the vernier exceeds one division of the rod by $\frac{1}{1000}=\frac{1}{1000}$ of a foot.

The vernier slides along the face or side of the rod.

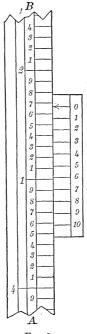

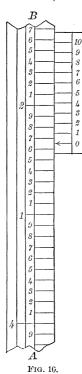

Fig. 9.

To use the vernier, place the lower end of the rod upon the ground, and move the vernier until its index or zero mark is opposite the point whose distance from the ground is desired. In the figure, the height of the index of the vernier is evidently 4.16 feet, increased by the distance of the index above the next lower line (4.16) of the rod. We shall now determine this distance.

Observe which line of the vernier is exactly opposite a line of the rod. In this case, the line of the vernier numbered 7 is opposite a line of the rod. Then, since each division of the vernier exceeds each division of the rod by $\frac{1}{1000}$ of a foot,

6 of the vernier is $\frac{1}{1000}$ of a foot above the next lower line of the rod. 5 of the vernier is $\frac{2}{1000}$ of a foot above the next lower line of the rod. 4 of the vernier is $\frac{3}{1000}$ of a foot above the next lower line of the rod. 3 of the vernier is $\frac{4}{1000}$ of a foot above the next lower line of the rod. 2 of the vernier is $\frac{5}{1000}$ of a foot above the next lower line of the rod. 1 of the vernier is $\frac{5}{1000}$ of a foot above the next lower line of the rod. 0 of the vernier is $\frac{7}{1000}$ of a foot above the next lower line of the rod.

Hence, the required reading is 4.16 + 0.007 = 4.167 feet.

In general, the following rule is evident:

Move the vernier until its zero line is at the required height; read the height to the nearest hundredth below the index, and write in the thousandths' place the number of the division line of the vernier which stands opposite any line of the rod.

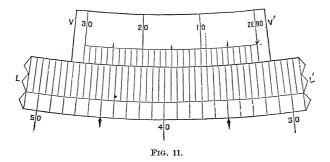

Second form. In this form (Fig. 10) the graduated part of the vernier is $\frac{9}{100}$ of a foot in length, and is divided into ten equal parts. Hence, one division of the vernier $=\frac{1}{10}$ of $\frac{9}{100}=\frac{9}{1000}$ of a foot; and one division of the vernier is less than one division of the rod by $\frac{9}{100}=\frac{9}{1000}=\frac{1}{1000}=\frac{1}{1000}$ of a foot.

The height of the index of the vernier in Fig. 10 is 4.16 feet, increased by the distance of the index from the next lower line (4.16) of the rod. We shall now determine this distance.

We observe that the line of the vernier numbered 7 stands exactly opposite the line of the rod numbered 3. Hence,

```
6 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod. 5 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod. 4 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod. 3 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod. 2 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod. 1 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod. 0 of the vernier is \frac{1}{1000} of a foot above the next lower line of the rod.
```

Hence, the required reading is 4.16 + 0.007 = 4.167 feet; and the rule is evidently the same as for the first form.

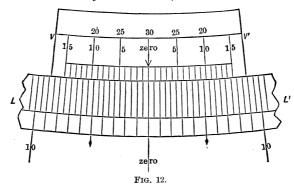

Compass Verniers. Let LL' (Fig. 11) represent the limb of the compass graduated to half-degrees, and VV' the vernier divided into thirty equal spaces, equal to twenty-nine spaces of the limb. Then one space of the vernier is less than one space of the limb by 1', and the reading may be obtained to single minutes.

In Fig. 11 the index or zero of the vernier stands between 32° and 32° 30′, and the line of the vernier marked 9 coincides with a line of the limb. Hence, the reading is 32° 9′.

When the index moves from the zero line of the limb in a direction contrary to that in which the numbers of the limb run, the number of minutes obtained as above must be subtracted from 30' to obtain the minutes required.

If, however, the vernier be made double, that is, if it have thirty spaces on each side of the zero line, it is always read directly. The usual form of the double vernier, shown in Fig. 12, has only fifteen spaces on each side of the zero line. When the vernier is turned to the *right* less than 15' past a division line of the limb, read the lower figures on the *left* of the zero line at any coincidence; if moved more than 15' past a division line of the limb, read the upper figures on the *right* of the zero line at any coincidence; and *vice versa*.

Uses of the Compass Vernier. The most important use of the vernier of the vernier compass is in setting off the variation of the needle (§ 23). If the variation of the needle at any place is known, by means of the vernier screw the compass circle may be turned through an arc equal to the variation. If the observer stands at the south end of the instrument, the vernier is turned to the right or left according as the variation is west or east. The compass will now give the bearings of the lines with the true meridian.

In order to retrace the lines of an old survey, turn the sights in the direction of a known line, and move the vernier until the needle indicates the old bearing. The arc moved over by the vernier will indicate the change of variation since the time of the old survey. If no line is definitely known, the change of variation from the time of the old survey will give the arc to be set off.

§ 8. THE SURVEYOR'S TRANSIT.

This instrument is shown on page 17.

The compass circle is similar to that of the compass. The vernier plate which carries the telescope has two verniers and moves entirely around the graduated limb of the main plate. The axis of the telescope carries a vertical circle which measures vertical angles to single minutes by means of a vernier. Under the telescope, and attached to it, is a spirit level by which horizontal lines may be run, or the difference of level between two stations found. The cross wires are two fine fibres of spider's web, or fine platinum wires, which extend across the tube of the telescope at right angles to each other; their intersection determines the optical axis or line of collimation of the telescope. The transit is levelled by four levelling screws which pass through a plate firmly fastened to the ball spindle, and rest in depressions on the upper side of the tripod plate.

A quick centring head enables the surveyor to change the position of the vertical axis horizontally without moving the tripod; and a quick levelling head enables him to bring the transit quickly to an approximately level position by the pressure of the hands, after which the levelling screws are used; also, to change the position of the transit without changing the position of the tripod legs, so as to bring the plummet exactly over any point.

To level the transit by the levelling screws. Turn the instrument until the spirit levels on the vernier plate are parallel to the vertical planes passing through opposite pairs of levelling screws. Take hold of opposite screw heads with the thumb and fore-finger of each hand, and turn both thumbs in or out as may be necessary to raise the lower side of the parallel plate and lower the other until the desired correction is made.

To use the telescope. Both the eye-piece and the object glass may be moved in and out by a rack-and-pinion movement. The eye-piece must be moved until the cross wires are

perfectly distinct; then a slight movement of the eye of the observer, from side to side, will produce no apparent change in the position of the threads upon the object. The object glass must be moved until the object is distinctly visible; and this must be repeated, if the distance of the object is changed.

§ 9. Uses of the Transit.

The transit may be used for all the purposes indicated in § 6, but with much greater precision than the compass. The principal use, however, of the transit is in measuring horizontal angles by means of the graduated limb and verniers.

To measure a horizontal angle with the transit. Place the transit over the vertex of the angle; level, and set the limb at zero. Turn the telescope in the direction of one of the sides of the angle, clamp to the spindle; unclamp the main plate, and turn the telescope until it is in the direction of the other side of the angle, and read the angle by the verniers. The object of the two verniers on the vernier plate is to correct any mistake that might arise from the want of exact coincidence in the centres of the verniers and the limb. The correct reading may be obtained by adding to the reading of one vernier the supplement of the reading of the other, and dividing by 2.

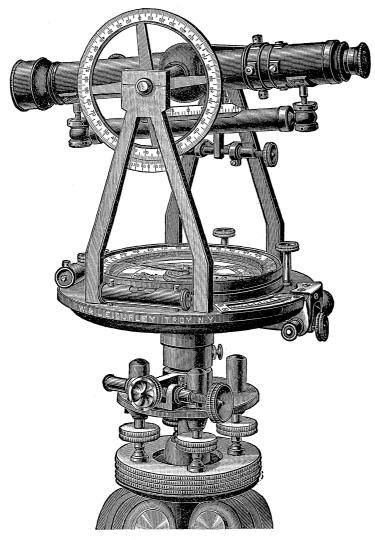

By turning off a right angle by this method, perpendiculars may be constructed with greater facility than by the chain.

§ 10. THE THEODOLITE.

The telescope of the transit can perform a complete revolution on its axis; whence the name *transit*. The theodolite differs from the transit chiefly in that its telescope cannot be so revolved. It is not much used in this country.

§ 11. THE RAILROAD COMPASS.

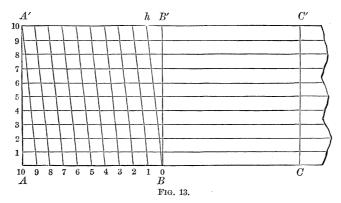

This instrument has all the features of the ordinary compass, and has also a vernier plate and graduated limb for measuring horizontal angles.

THE SURVEYOR'S TRANSIT.

§ 12. PLOTTING.

The principal plotting instruments are a ruler, pencil, straight-line pen, hair-spring dividers, diagonal scale, a right triangle of wood, and a circular protractor. A T-square will also be found convenient.

The Diagonal Scale. A portion of this scale is shown in Fig. 13. AB is the unit. AB and A'B' are divided into ten equal parts, and B is joined with h, the first division point to the left of B'; the first division point to the left of B is joined with the second to the left of B', etc.

The part of the horizontal line numbered 1 intercepted between BB' and Bh is evidently $\frac{1}{10}$ of $\frac{1}{10} = \frac{1}{100}$ of the unit; the part of the horizontal line numbered 2 intercepted between BB' and Bh is $\frac{2}{100}$ of the unit, etc.

The method of using this scale is as follows:

Let it be required to lay off the distance 1.43.

Place one foot of the dividers at the intersection of the horizontal line numbered 3 and the diagonal numbered 4, and place the other foot at the intersection of the vertical line numbered 1 (CC') and the horizontal line numbered 3; the distance between the feet of the dividers will be the distance required. For, measuring along the horizontal line numbered 3, from CC' to BB' is 1; from BB' to Bh is 0.03; and from Bh to the diagonal numbered 4 is 0.4; and 1+0.03+0.4=1.43.

The Circular Protractor. This instrument (Fig. 14) usually consists of a semi-circular piece of brass or german silver, having its arc divided into degrees and its centre marked.

To lay off an angle with the protractor, place the centre over the vertex of the angle, and make the diameter coincide with the given side of the angle. Mark off the number of degrees in the given angle, and draw a line through this point and the vertex.

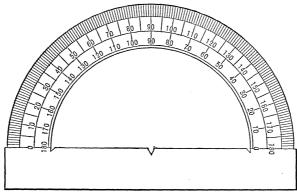

Fig. 14.

Some protractors have an arm which carries a vernier, by which angles may be constructed to single minutes.

To draw through a given point a line parallel to a given line, make one of the sides of a triangle coincide with the given line, and, placing a ruler against one of the other sides, move the triangle along the ruler until the first side passes through the given point; then draw a line along this side.

To draw through a given point a line perpendicular to a given line, make the hypotenuse of a right triangle coincide with the given line, and, placing a ruler against one of the other sides of the triangle, revolve the triangle about the vertex of the right angle as a centre until its other perpendicular side is against the ruler; then move the triangle along the ruler until the hypotenuse passes through the given point, and draw a line along the hypotenuse.

CHAPTER II.

LAND SURVEYING.

§ 13. Definition.

Land Surveying is the art of measuring, laying out, and dividing land, and preparing a plot.

§ 14. Determination of Areas.

The unit of land measure is the

acre = 10 square chains = 4 roods

=160 square rods, perches, or poles.

Areas are referred to the horizontal plane, no allowance being made for inequalities of surface.

For convenience of reference, the following rules for areas are given:

Let A, B, and C be the angles of a triangle, and a, b, and cthe opposite sides, respectively; and let $s = \frac{1}{2}(a+b+c)$.

Area of triangle
$$ABC = \frac{1}{2}$$
 base \times altitude [A]

$$= \frac{1}{2} bc \sin A$$
 [B]

$$= \frac{1}{2}bc \sin A$$

$$= \frac{1}{2}bc \sin A$$

$$= \frac{1}{2}\frac{a^2 \sin B \sin C}{\sin (B+C)}$$

$$= \sqrt{s(s-a)(s-b)(s-c)}.$$
[D]

$$=\sqrt{s(s-a)(s-b)(s-c)}.$$
 [D]

Area of rectangle = base \times altitude.

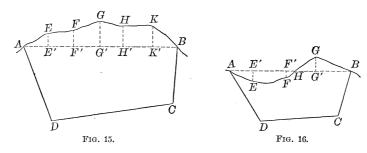

Area of trapezoid $=\frac{1}{2}$ sum of parallel sides \times altitude.

PROBLEM 1. To determine the area of a triangular field.

Measure the necessary parts with a Gunter's chain, or with a chain and transit, and compute by formula [A], [B], [C], or [D].

$\ensuremath{\mathrm{Problem}}$ 2. To find the area of a field having any number of straight sides.

- (α) . Divide the field into triangles by diagonals; find the area of each triangle and take the sum.
- (b) Run a diagonal, and perpendiculars from the opposite vertices to this diagonal. The field is thus divided into right triangles, rectangles, and trapezoids, the areas of which may be found and the sum taken.

$\ensuremath{\mathsf{ProbLem}}$ 3. To find the area of a field having an irregular boundary line.

- (a) Let AGBCD (Fig. 15) represent a field having a stream AEFGHKB as a boundary line. Run the line AB. From E, F, G, H, and K, prominent points on the bank of the stream, let fall perpendiculars EE', FF', etc., upon AB. Regarding AE, EF, etc., as straight lines, the portion of the field cut off by AB is divided into right triangles, rectangles, and trapezoids, the necessary elements of which can be measured and the areas computed. The sum of these areas added to the area of ABCD will give the area required.
- (b) When the irregular boundary line crosses the straight line joining its extremities, as in Fig. 16, the areas of AEFH and HGB may be found separately, as in the preceding case. Then the area required = ABCD + HGB AEFH.

$\ensuremath{\mathrm{Problem}}$ 4. To determine the area of a field from two interior stations.

Let ABCD (Fig. 17) represent a field, and P and P' two stations within it. Measure PP' with great exactness. Measure the angles between PP' and the lines from P and P' to the corners of the field.

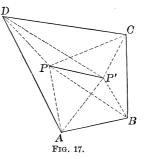

In the triangle PP'D, PP' and the angles P'PD and PP'D are known;

hence, PD may be found. In like manner, PC may be found. Then in the triangle PDC, PD, PC, and the angle DPC are known; hence, the area of PDC may be computed.

In like manner, the areas of all the triangles about P and P' may be determined.

Area
$$ABCD = PAD + PDC + PCB + PBA$$
. Also

Area
$$ABCD = P'AD + P'DC + P'CB + P'BA$$
.

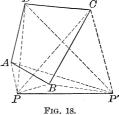

PROBLEM 5. To determine the area of a field from two exterior stations.

Let ABCD (Fig. 18) represent the field, and P and P' the stations. Determine the areas of the triangles PAD, PDC, PCB, and PBA, as in the preceding problem.

Area
$$ABCD = PAD + PDC + PBC - PBA$$
. Also,

Area
$$ABCD = P'AD + P'DC + P'BA - P'BC$$
.

Exercise I.

- 1. Required the area of a triangular field whose sides are respectively 13, 14, and 15 chains.
- 2. Required the area of a triangular field whose sides are respectively 20, 30, and 40 chains.
- 3. Required the area of a triangular field whose base is 12.60 chains, and altitude 6.40.
- 4. Required the area of a triangular field which has two sides 4.50 and 3.70 chains, respectively, and the included angle 60°.
- 5. Required the area of a field in the form of a trapezium, one of whose diagonals is 9 chains, and the two perpendiculars upon this diagonal from the opposite vertices 4.50 and 3.25 chains.

6. Required the area of the field ABCDEF (Fig. 19), if AE = 9.25 chains, FF' = 6.40 chains, BE = 13.75 chains, DD'

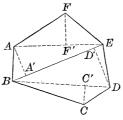

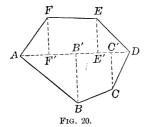

Fig. 19.

= 7 chains, DB = 10 chains, CC' = 4 chains, and AA' = 4.75 chains.

7. Required the area of the field ABCDEF (Fig. 20), if AF' = 4 chains, FF' = 6 chains, EE' = 6.50 chains, AE' = 9 chains, AD = 14 chains, AC' = 10 chains, AB' = 6.50 chains, BB' = 7 chains CC' = 6.75 chains.

8. Required the area of the field AGBCD (Fig. 15), if the

diagonal AC = 5, BB' (the perpendicular from B to AC) = 1, DD' (the perpendicular from D to AC) = 1.60, EE' = 0.25, FF' = 0.25, GG' = 0.60, HH' = 0.52, KK' = 0.54, AE' = 0.2, E'F' = 0.50, F'G' = 0.45, G'H' = 0.45, H'K' = 0.60, and K'B = 0.40.

9. Required the area of the field AGBCD (Fig. 16), if AD = 3, AC

= 5, AB = 6, angle DAC = 45°, angle BAC = 30°, AE' = 0.75, AF' = 2.25, AH = 2.53, AG' = 3.15, EE' = 0.60, FF' = 0.40, and GG' = 0.75.

10. Determine the area of the field ABCD from two interior stations, P and P', if PP' = 1.50 chains,

 $PP'C = 89^{\circ} 35', PP'D = 349^{\circ} 45', P'PD = 165^{\circ} 40', PP'B = 185^{\circ} 30', P'PB = 3^{\circ} 35', P'PC = 303^{\circ} 15'. PP'A = 309^{\circ} 15', P'PA = 113^{\circ} 45',$

11. Determine the area of the field ABCD from two exterior stations, P and P', if PP' = 1.50 chains,

 $P'PB = 41^{\circ} 10', P'PD = 104^{\circ} 45', PP'B = 132^{\circ} 15',$ $P'PA = 55^{\circ} 45', PP'D = 66^{\circ} 45', PP'A = 103^{\circ} 0'.$ $P'PC = 77^{\circ} 20', PP'C = 95^{\circ} 40',$

RECTANGULAR SURVEYING.

§ 15. Definitions.

An East and West Line is a line perpendicular to the magnetic meridian.

The Latitude of a line is the distance between the east and west lines through its extremities.

The **Departure of a line** is the distance between the meridians through its extremities.

Note. When a line extends north of the initial point the latitude is called a northing; when it extends south, a southing; when it extends east the departure is called an easting; when it extends west, a westing.

The Meridian Distance of a point is its distance from a meridian.

The **Double Meridian Distance of a course** is double the distance of the middle point of the course from the meridian.

Let AB (Fig. 21) represent a line, and NAS the magnetic meridian. Let BB' be perpendicular to NS.

The bearing of the line AB is the angle BAB'.

The latitude of the line AB is AB'.

The departure of the line AB is BB'.

The meridian distance of the point B is BB'.

In the right triangle ABB',

$$AB' = AB \times \cos BAB',$$

 $BB' = AB \times \sin BAB'.$

and

Hence, $latitude = distance \times cos \ of \ bearing$, and $departure = distance \times sin \ of \ bearing$.

The latitudes and departures corresponding to any distance and bearing may be found from the above formulas by means of a table of natural sines and cosines, or from "The Traverse Table."*

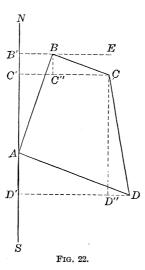

B B B S Fig. 21.

* See Table VII. of Wentworth & Hill's Five-Place Logarithmic and Trigonometric Tables.

§ 16. FIELD NOTES, COMPUTATION, AND PLOTTING.

The field notes are kept in a book provided for the purpose. The page is ruled in three columns, in the first of which is written the number of the station; in the second, the bearing of the side; and in the third, the length of the side.

Example 1. To survey the field ABCD (Fig. 22).

FIELD NOTES.

1	N. 20° E.	8.66
2	S. 70° E.	5.00
3	S. 10° E.	10.00
4	N. 70° W.	10.00

(a) To obtain the field notes.

Place the compass at A, the first station, and take the bearing of AB (§ 6); suppose it to be N. 20° E. Write the result in the second column of the field notes opposite the number of the station. Measure AB = 8.66 chains, and write the result in the third column of the field notes.

Place the compass at B, and, after testing the bearing of AB (§ 6), take the bearing of BC, measure BC, and write the results in the field notes; and so continue until the bearing and length of each side have been recorded.

(b) To compute the area.

I.	II.	III.	IV.	v.	VI.	VII.	VIII.	IX.	X.	XI.
Side.	Bearing.	Dist.	N.	s.	Ε,	w.	м. D.	D.M.D.	N.A.	S.A.
AB	N. 20° E.	8.66	AB' 8.14		BB' 2.96		BB' 2.96.	BB' 2.96	2ABB' 24.0944	
BC	S. 70° E.	5.00		B'C' 1.71	CC'' 4.70		CC' 7.66	$\begin{array}{c} BB'+CC'\\ 10.62\end{array}$		2C'CBB' 18.1602
CD	S. 10° E.	10,00		0.85	$DD^{\prime\prime}$		$\frac{DD'}{9.40}$	CC'+DD' 17.06		2D'DCC' 168.0410
DA	N. 70° W.	10.00	D'A 3.42			DD' 9.40	0	DD' 9.40	2ADD' 32.1480	
		33.66	11.56	11.56	9.40	9.40			56.2424	186.2012

The survey may begin at any corner of the field; but in computing the area, the field notes should be arranged so that the

most eastern or most western station will stand first. For the sake of uniformity, we shall always begin with the most western station, and keep the field on the right in passing around it.

```
186,2012
    56.2424
2 129.9588
10 64.98 sq. chains.
     6.498 acres.
```

The field notes occupy the first three of the eleven columns in the above tablet. Columns IV., V., VI., and VII. contain the latitudes and departures corresponding to the sides, and taken from the Traverse Table. The lines represented by these numbers are indicated immediately above each number. Column VIII. contains the meridian distances of the points B, C, D, and A, taken in order. Column IX. contains the double meridian distances of the courses. Their composition is indicated by the letters immediately above the numbers. Column X. contains the products of the double meridian distances by the northings in the same line. The first number,

```
24.0944 = 2.96 \times 8.14 = BB' \times AB' = 2 area of the triangle ABB';
32.1480 = 9.40 \times 3.42 = DD' \times AD' = 2 area of the triangle ADD'.
```

Column XI. contains the products of the double meridian distances by the southings in the same line. The first number,

```
18.1602 = 10.62 \times 1.71 = (BB' + CC') \times B'C'
                          = 2 area of the trapezoid C'CBB';
168.0410 = 17.06 \times 9.85 = (CC' + DD') \times D'C'
                          = 2 area of the trapezoid D'DCC'.
```

The sum of the north areas in column X.

```
= 56.2424 = 2 (ABB' + ADD').
```

The sum of the south areas in column XI.

```
= 186.2012 = 2 (C'CBB' + D'DCC').
```

(C'CBB' + D'DCC') - (ABB' + ADD') = ABCD. 2(C'CBB' + D'DCC') - 2(ABB' + ADD') = 2ABCD;Hence. that is, 186.2012 - 56.2424 = 129.9588 = 2 ABCD.

Hence, area $ABCD = \frac{1}{2}$ of 129.9588 = 64.9794 sq. ch. = 6.498 acres.

(c) To make the plot.

But

The plot or map may be drawn to any desired scale. If a line one inch in length in the plot represents a line one chain in length, the plot is said to be drawn to a scale of one chain to an inch. In this case the plot (Fig. 22) is drawn to a scale of eight chains to an inch.

Draw the line NAS to represent the magnetic meridian, and lay off the first northing AB' = 8.14 (§ 12). Draw the indefinite line B'E perpendicular to NS and lay off B'B, the first easting = 2.96. Join A and B; then the line AB will represent the first side of the field. Through B draw BC'' perpendicular to BB', and make BC''=1.71, the first southing. Through C'' draw C''C perpendicular to BC'', and equal to 4.70, the second easting. Join B and C. The line BC will represent the second side of the field.

Proceed in like manner until the field is completely represented. The extremity of the last line D'A, measured from D', should fall at A. This will be a test of the accuracy of the plot.

By drawing the diagonal AC, and letting fall upon it perpendiculars from B and D, the quadrilateral ABCD is divided into two triangles, the bases and altitudes of which may be measured and the area computed approximately.

Other methods of plotting will suggest themselves, but the method just explained is one of the best.

Balancing the Work.

In the survey, we pass entirely around the field; hence, we move just as far north as south. Therefore, the sum of the northings should equal the sum of the southings. In like manner, the sum of the eastings should equal the sum of the westings. In this way the accuracy of the field work may be tested.

In Example 1, the sum of the northings is equal to the sum of the southings, being 11.56 in each case; and the sum of the eastings is equal to the sum of the westings, being 9.40 in each case. Hence, the work balances.

In actual practice the work seldom balances. When it does not balance, corrections are generally applied to the latitudes and departures, by the following rules:

The perimeter of the field: any one side

:: total error in latitude : correction;

:: total error in departure: correction.

If special difficulty has been experienced in taking a particular bearing, or in measuring a particular line, the corrections should be applied to the corresponding latitudes and departures.

The amount of error allowable varies in the practice of different surveyors, and according to the nature of the ground. An error of 1 link in 8 chains would not be considered too great on smooth, level ground; while, on rough ground, an

error of 1 link in 2 or 3 chains might be allowed. If the error is considerable, the field measurements should be repeated.

Example 2. Let it be required to survey the field AB CDEF (Fig. 23).

FIELD NOTES.

	1	N. 73° 30′ W.	5.00
	2	S. 16° 30′ W.	5.00
ĺ	3	N. 28° 30′ W.	7.07
	4	N. 20° 00′ E.	11.18
	5	S. 43° 30′ E.	5.00

EXPLANATION. The first station in the field notes is D, but we rearrange the numbers in the tablet so that A stands first. The northings and southings balance, but the eastings exceed the westings by 1 link. We apply the correction to the westing 4.79 (the distance DE being in doubt), making it 4.80, and rewrite

all the latitudes and departures in the next four columns, incorporating the correction. In practice, the corrected numbers are written in red ink.

The remainder of the computation does not require explanation.

It will be seen that this method of computing areas is perfectly general.

§ 17. Supplying Omissions.

If, for any reason, the bearing and length of any side do not appear in the field notes, the latitude and departure of this side may be found in the following manner:

Find the latitudes and departures of the other sides as usual. The difference between the northings and southings will give the northing or southing of the unknown side, and the difference between the eastings and westings will give the easting or westing of the unknown side.

If the length and bearing of the unknown side are desired, they may be found by solving the right triangle, whose sides are the latitude

and departure found by the method just explained, and whose hypotenuse is the length required.

§ 18. IRREGULAR BOUNDARIES.

If a field have irregular boundaries, its area may be found by offsets, as explained in § 14, Prob. 3.

§ 19. Obstructions.

If the end of a line be not visible from its beginning, or if the line be inaccessible, its length and bearing may be found as follows:

- 1. By means of a random line (§ 4, 3).
- 2. When it is impossible to run a random line, which is frequently the case on account of the extent of the obstruction, the following method may be used:

Let AB (Fig. 24) represent an inaccessible line whose extremities A and B only are known, and B invisible from A.

Set flag-staffs at convenient points, C and D. Find the bearings and lengths of AC, CD, and DB, and then proceed to find the latitude and departure of AB, as in § 17.

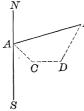

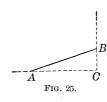

Fig. 24.

EXAMPLE. Suppose that we have the following notes (see Fig. 24):

SIDE.	BEARING.	DIST.	N.	s.	E.	w.
AC CD DB	S. 45° E. E. N. 30° E.	3.00 3.50 4.83	4.18	2.12	2.12 3.50 2.42	
			4.18	2.12	8.04	0

4.18 The northing of AB is 2.06, and the easting, 8.04; which numbers may be entered in the tablet in the columns N. and E., opposite the side AB.

If the bearing and length of AB are required, construct the right triangle ABC (Fig. 25), making AC = 8.04 and BC = 2.06.

$$\tan BAC = \frac{BC}{AC} = \frac{2.06}{8.04} = 0.256.$$

Hence, the angle $BAC = 14^{\circ} 22'$.

Also,
$$AB = \sqrt{\overline{AC^2 + BC^2}} = \sqrt{8.04^2 + 2.06^2} = 8.29.$$

Therefore, the bearing and length of AB are N. 75° 38′ E. 8.29.

Note. Keep all the decimal figures until the result is obtained; then reject all decimal figures but two, increasing the last decimal figure retained by 1, if the third decimal figure is 5 or greater than 5.

Exercise II.

In examples 5 and 6 detours were made on account of inaccessible sides (\S 19, 2). The notes of the detours are written in braces.

§ 20. Modification of the Rectangular Method.

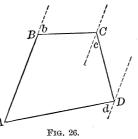

The area of a field may be found by a modification of the rectangular method, if its sides and interior angles are known.

Let A, B, C, D, represent the interior angles of the field ABCD (Fig. 26). Let the side AB determine the direction of reference.

The bearing of AB, with reference to AB, is 0° .

The bearing of BC, with reference to AB, is the angle $b = 180^{\circ} - B$.

The bearing of CD, with reference A to AB, is the angle c = C - b.

The bearing of DA, with reference to AB, is the angle d = A. The area may now be computed by the rectangular method, regarding AB as the magnetic meridian.

In practice, the exterior angles, when acute, are usually measured.

As the interior angles may be measured with considerable accuracy by the transit, the latitudes and departures should be obtained by using a table of natural sines and cosines.

EXERCISE III.

1. Find the area of the field ABCD, in which the angle $A=120^{\circ}$, $B=60^{\circ}$, $C=150^{\circ}$, and $D=30^{\circ}$; and the side AB=4 chains, BC=4 chains, CD=6.928 chains, and DA=8 chains.

Keep three decimal places, and use the Traverse Table.

2. Find the area of the farm ABCDE, in which the angle $A = 106^{\circ} 19'$, $B = 99^{\circ} 40'$, $C = 120^{\circ} 20'$, $D = 86^{\circ} 8'$, and $E = 127^{\circ} 33'$; and the side AB = 79.86 rods, BC = 121.13 rods, CD = 90 rods, DE = 100.65 rods, and EA = 100 rods.

Use the table of natural sines and cosines, keeping two decimal places as usual. $\,$

§ 21. General Remarks on Determining Areas.

Operations depending upon the reading of the magnetic needle must lack accuracy. Hence, when great accuracy is required (which is seldom the case in land surveying), the rectangular method (§§ 16–19) cannot be employed.

The best results are obtained by the methods explained in §§ 14 and 20, the horizontal angles being measured with the transit, and great care exercised in measuring the lines.

§ 22. The Variation of the Needle.

The Magnetic Declination, or variation of the needle, at any place, is the angle which the magnetic meridian makes with the true meridian, or north and south line. The variation is east or west, according as the north end of the needle lies east or west of the true meridian. Western variation is indicated by the sign +, and eastern by the sign -.

Irregular Variations are sudden deflections of the needle, which occur without apparent cause. They are sometimes accompanied by auroral displays and thunder storms, and are most frequent in years of greatest sun-spot activity.

Solar-Diurnal Variation. North of the equator, the north end of the needle moves to the west, from 8 A.M. to 1.30 P.M., about 6' in winter and 11' in summer, and then returns gradually to its normal position.

Secular Variation is a change in the same direction for about a century and a half; then in the opposite direction for about the same time.

The line of no variation, or the **Agonic Line**, is a line joining those places at which the magnetic meridian coincides with the true meridian. In the United States, this line at present (1895) passes through Michigan, Ohio, Eastern Kentucky, the extreme southwest of Virginia, and the Carolinas. It is moving gradually westward, so that the variation is increasing

at places east of this line, and decreasing at places west of this line. East of this line the variation is westerly, and west of this line the variation is easterly.

The table on pages 234 and 235, which has been prepared by permission from data furnished by the United States Coast and Geodetic Survey, shows the magnetic variation at different places in the United States and Canada for several years; also, the annual change for 1895.

§ 23. To Establish a True Meridian.

This may be done as follows:

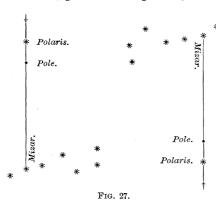

- 1. By means of Burt's Solar Compass (§ 25).
- 2. By observations of Polaris.

The North Star or Polaris revolves about the pole at present at the distance of about $1\frac{1}{4}^{\circ}$; hence, it is on the meridian twice in 23 h. 56 m. 4 s. (a sidereal day), once above the pole, called the upper culmination, and 11 h. 58 m. 2 s. later below the pole, called the lower culmination. It attains its greatest eastern or western elongation, or greatest distance from the meridian, 5 h. 59 m. 1 s. after the culmination.

The following table gives the mean local time of the upper culmination of Polaris for 1895 at Washington. The time is growing later at the rate of about one minute in three years.

Month.	FIRST DAY.	ELEVENTH DAY.	TWENTY-FIRST DAY.
January February March April	H. M. 6 35 р.м. 4 32 р.м. 2 42 р.м. 12 40 р.м.	H. M. 5 55 P.M. 3 53 P.M. 2 03 P.M. 12 00 M.	H. M. 5 16 P.m. 3 14 P.m. 1 23 P.m. 11 17 A.M.
May June July August September	10 38 a.m. 8 37 a.m. 6 39 a.m. 4 38 a.m. 2 36 a.m.	9 59 A.M. 7 57 A.M. 6 00 A.M. 4 00 A.M. 1 57 A.M.	9 20 A.M. 7 18 A.M. 5 21 A.M. 3 19 A.M. 1 18 A.M.
October November December	12 39 A.M. 10 37 P.M. 8 39 P.M.	11 59 P.M. 9 57 P.M. 7 59 P.M.	11 20 P.M. 9 18 P.M. 7 20 P.M.

The time of the upper culmination of Polaris may be found by means of the star Mizar, which is the middle one of the three stars in the handle of the Dipper (in the constellation of the Great Bear). It crosses the meridian at almost exactly the same time as Polaris. Suspend from a height of about 20 feet a plumb-line, placing the bob in a pail of water to lessen its vibrations. About 15 feet south of the plumb-line, upon a horizontal board firmly supported at a convenient height, place a compass sight fastened to a board a few inches square. At night, when Mizar by estimation approaches the meridian, place the compass sight in line with Polaris and the

plumb-line, and move it so as to keep it in this line until the plumb-line also falls on Mizar (Fig. 27). Note the time; then (1895) fifty-one seconds later Polaris will be on the meridian.

This interval is gradually increasing at the rate of 21 seconds a year.

If the lower culmination takes place at night, the time may be found in a similar manner.

When Mizar cannot conveniently be used, as in the spring, δ Cassiopeiae may be employed. This is the star at the bottom of the first stroke of the W frequently imagined to connect roughly the five brightest stars in Cassiopeia. In 1895 it culminates 1.75 minutes before Polaris, with an annual increase of the interval of 20 seconds.

Instead of the compass sight, any upright with a small opening or slit may be used.

- (a) To locate the true meridian by the position of Polaris at its culmination.
- 1. By using the apparatus described in finding the time of culmination. At the time of culmination bring Polaris, the plumb-line, and the compass sight into line. The compass sight and the plumb-line will give two points in the true meridian.
- 2. By means of the transit. Bring the telescope to bear on Polaris at the time of culmination, holding a light near to make the wires visible, if the observation is made at night. The telescope will then lie in the plane of the meridian, which may be marked by bringing the telescope to a horizontal position.
- (b) To locate the meridian by the position of Polaris at greatest elongation.

The **Azimuth** of a star is the angle which the meridian plane makes with a vertical plane passing through the star and the zenith of observer.

A star is said to be at its greatest elongation, when its vertical circle ZN (Fig. 28) is tangent to its diurnal circle, that is, perpendicular to the hour circle PN.

Let Z (Fig. 28) represent the zenith of the place, P the pole, and N Polaris at its greatest elongation; that is, when its vertical circle ZN is perpendicular to the hour circle PN. Let ZP,

ZN, and PN be arcs of great circles; then N will be a right angle.

 $\sin PN = \cos{(90^\circ - ZP)}\cos{(90^\circ - Z)}.$ [Spher. Trig. § 47.]

But ZP = the complement of the latitude. Hence, $90^{\circ} - ZP =$ the latitude of the place.

Hence, $\sin PN = \cos \operatorname{latitude} \times \sin Z$.

Hence, $\sin Z = \frac{\sin PN}{\cos \text{latitude}}$

Hence, Z (the azimuth of Polaris) can be found if the latitude of the place and the greatest elongation of Polaris (PN) are known.

The following table gives the mean value of the latter element for each year from 1895 to 1906.

GREATEST ELONGATION OF POLARIS.

-						
	1895	1° 15.1′	1899	1° 13.8′	1903	$1^{\circ}12.6'$
	1896	1° 14.8′	1900	1° 13.5′	1904	1° 12.3′
-	1897	1° 14.5′	1901	1° 13.2′	1905	1° 12.0′
1	1898	1° 14.1′	1902	1° 12.9′	1906	1° 11.7′

The greatest elongation of Polaris, or the polar distance, is given in the Nautical Almanac. The table gives this element for Jan. 1. It may be found for other dates by interpolation.

To obtain a line in the direction of Polaris at greatest elongation.

- 1. By using the apparatus for finding the time of culmination. A few minutes before the time of greatest elongation (5 h. 59 m. 1 s. after culmination), place the compass sight in line with the plumb-line and Polaris, and keep it in line with these, by moving the board in the opposite direction, until the star begins to recede. At this moment the sight and plumb-line are in the required line.
- 2. By means of the transit. A few minutes before the time of greatest elongation, bring the telescope to bear on the star, and follow it, keeping the vertical wire over the star until it begins to recede. The telescope will then be in the required line.

To establish the meridian. Having the transit sighted in the direction of the line just found, turn it through an angle equal to the azimuth in the proper direction.

§ 24. DIVIDING LAND.

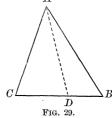

The surveyor must, for the most part, depend on his general knowledge of Geometry and Trigonometry, and his own ingenuity, for the solutions of problems that arise in dividing land.

PROBLEM 1. To divide a triangular field into two parts having a given ratio, by a line through a A given vertex.

Let ABC (Fig. 29) be the triangle, and A the given vertex.

Divide BC at D, so that $\frac{BD}{DC}$ equals the given ratio, and join A and D. ABD and ADC will be the parts required; for

ABD:ADC::BD:DC.

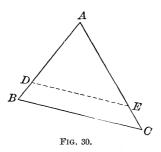

PROBLEM 2. To cut off from a triangular field a given area, by a line parallel to the base.

Let ABC (Fig. 30) be the triangle, and let DE be the division line required.

$$\sqrt{ABC} : \sqrt{ADE} : : AB : AD.$$

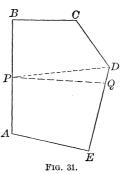

$$\therefore AD = AB \sqrt{\frac{ADE}{ABC}} \cdot$$

PROBLEM 3. To divide a field into two parts having a given ratio, by a line through a given point in the perimeter.

Let ABCDE (Fig. 31) represent the field, P the given point, and PQ the required division line.

The areas of the whole field and of the required parts having been determined, run the line PD from P to a corner D, dividing A the field, as near as possible, as required. Determine the area PBCD.

The triangle PDQ represents the part which must be added to PBCD to make the required division.

Area
$$PDQ = \frac{1}{2} \times PD \times DQ \times \sin PDQ$$
.

Hence,
$$DQ = \frac{2 \operatorname{area} PDQ}{PD \times \sin PDQ}$$

Note. $DQ = \frac{2 \text{ area } PDQ}{\text{perpendicular from } P \text{ on } DE}$. This perpendicular from P on DE may be run and measured directly.

PROBLEM 4. To divide a field into a given number of parts, so that access to a pond of water is

given to each.

Let ABCDE (Fig. 32) represent the field, and P the pond. Let it be required to divide the field into four parts. Find the area of the field and of each part.

Let AP be one division line. Run PE, and find the area APE. Take the difference between APE and the area of one of the required parts; this will give the area of the triangle PQE, from which QE may be found, as in Problem 3. Join P and Q; PAQ will be one of the required parts. In like manner, PQR and PAS are determined; whence, PSR must be the fourth part required.

Fig. 32.

- 1. From the square ABCD, containing 6 a. 1 r. 24 r., part off 3 a. by a line EF parallel to AB.
- 2. From the rectangle ABCD, containing 8 A. 1 R. 24 P., part off 2 A. 1 R. 32 P. by a line EF parallel to AD=7 ch. Then, from the remainder of the rectangle, part off 2 A. 3 R. 25 P., by a line GH parallel to EB.
- 3. Part off 6 A. 3 R. 12 P. from a rectangle ABCD, containing 15 A., by a line EF parallel to AB; AD being 10 ch.
- 4. From a square ABCD, whose side is 9 ch., part off a triangle which shall contain 2 a. 1 g. 36 g., by a line BE drawn from B to the side AD.

- 5. From ABCD, representing a rectangle, whose length is 12.65 ch., and breadth 7.58 ch., part off a trapezoid which shall contain 7 A. 3 R. 24 P., by a line BE from B to DC.
- 6. In the triangle ABC, AB = 12 ch., AC = 10 ch., BC = 8 ch.; part off 1 A. 2 R. 16 P., below the line DE parallel to AB.
- 7. In the triangle ABC, AB = 26 ch., AC = 20 ch., and BC = 16 ch.; part off 6 A. 1 R. 24 P., below the line DE parallel to AB.
- 8. It is required to divide the triangular field ABC among three persons whose claims are as the numbers 2, 3, and 5, so that they may all have the use of a watering-place at C; AB = 10 ch., AC = 6.85 ch., and CB = 6.10 ch.
- 9. Divide the five-sided field ABCHE among three persons, X, Y, and Z, in proportion to their claims, X paying \$500, Y paying \$750, and Z paying \$1000, so that each may have the use of an interior pond at P, the quality of the land being equal throughout. Given AB = 8.64 ch., BC = 8.27 ch., CH = 8.06 ch., HE = 6.82 ch., and EA = 9.90 ch. The perpendicular PD upon AB = 5.60 ch., PD' upon BC = 6.08 ch., PD'' upon EA = 5.40 ch. Assume PH as the divisional fence between X's and Z's shares; it is required to determine the position of the fences PM and PN between X's and Y's shares and Y's shares, respectively.
- 10. Divide the triangular field ABC, whose sides AB, AC, and BC are 15, 12, and 10 ch., respectively, into three equal parts, by fences EG and DF parallel to BC, without finding the area of the field.
- 11. Divide the triangular field ABC, whose sides AB, BC, and AC are 22, 17, and 15 ch., respectively, among three persons, A, B, and C, by fences parallel to the base AB, so that A may have 3 A. above the line AB, B, 4 A. above A's share, and C, the remainder.

§ 25. United States Public Lands.

Burt's Solar Compass.

This instrument, which is exhibited on the following page, may be used for most of the purposes of a compass or transit. Its most important use, however, is to run north and south lines in laying out the public lands.

A full description of the solar compass, with its principles, adjustments, and uses, forms the subject of a considerable volume, which should be in the hands of the surveyor who uses this instrument. The limits of our space will allow only a brief reference to its principal features.

The main plate and standards resemble these parts of the compass.

a is the latitude arc.

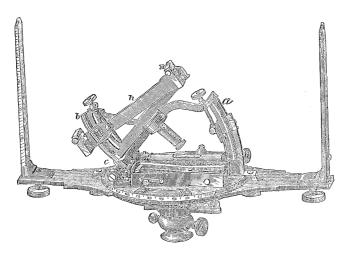

b is the declination arc.

h is an arm, on each end of which is a solar lens having its focus on a silvered plate on the other end.

c is the hour arc.

n is the needle-box, which has an arc of about 36°.

To run a north and south line with the solar compass. Set off the declination of the sun on the declination arc. Set off the latitude of the place (which may be determined by this instrument) on the latitude arc. Set the instrument over the station, level, and turn the sights in a north and south direction, approximately, by the needle. Turn the solar lens toward the sun, and bring the sun's image between the equatorial lines on the silvered plate. Allowance being made for refraction, the sights will then indicate a true north and south line.

BURT'S SOLAR COMPASS.

Laying Out the Public Lands.

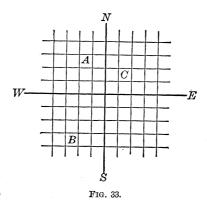

The public lands north of the Ohio River and west of the Mississippi are generally laid out in townships approximately six miles square.

A Principal Meridian, or true north and south line, is first run by means of Burt's Solar Compass, and then an east and west line, called a Base Line.

Parallels to the base line are run at intervals of six miles,

and north and south lines at the same intervals. Thus the tract would be divided into townships exactly six miles square, if it were not for the convergence of the meridians on account of the curvature of the earth.

The north and south lines, or meridians, are called Range Lines. The east and west lines, or parallels, are called Township Lines.

Let NS (Fig. 33) represent a principal meridian, and WE a base line; and let the other lines represent meridians and parallels at intervals of six miles.

The small squares, A, B, C, etc., will represent townships.

A would be designated thus: T. 3 N., R. 2 W.; that is, township three north, range two west; which means that the township is in the third tier north of the base line, and in the second tier west of the principal meridian. B and C, respectively, would be designated thus: T. 4 S., R. 3 W.; and T. 2 N., R. 2 E.

The townships are divided into sections approximately one

6	5	4	3	2	1
7	8	9	10	11	12
18	17	16	15	14	13
19	20	21	22	23	24
30	29	28	27	26	25
31	32	33	34	35	36

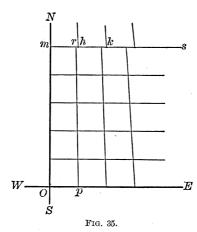

Fig. 34.

mile square, and the sections are divided into quarter-sections. The township, section, and quarter-section corners are permanently marked.

The sections are numbered, beginning at the northeast corner, as in Fig. 34, which represents a township divided into sections. The quarter-sections are designated, according to their position, as N. E., N.W., S. E., and S.W.

Every fifth parallel is called a Standard Parallel or Correction Line.

Let NS (Fig. 35) represent a principal meridian; WE a

base line; rp, etc., meridians; and ms the fifth parallel. If Op equals six miles, mr will be less than six miles on account of the convergence of the meridians. Surveyors are instructed to make Op such a distance that mr shall be six miles; then mh, hk, etc., are taken similarly. At the correction lines north of ms the same operation is repeated.

The township and section lines are surveyed in such

an order as to throw the errors on the north and outer townships and sections.

If, in running a line, a navigable stream or a lake more than one mile in length is encountered, it is meandered by marking the intersection of the line with the bank and running lines from this point along the bank to prominent points which are marked, and the lengths and bearings of the connecting lines recorded.

Six principal meridians have been established and connected. In addition to these there are several independent meridians in the Western States and Territories which will in time be connected with each other and with the eastern system.

§ 26. Plane-Table Surveying.*

After the principal lines of a survey have been determined and plotted, the details of the plot may be filled in by means of the plane-table; or, when a plot only of a tract of land is desired, this instrument affords the most expeditious means of obtaining it.

An approved form of the plane-table, as used in the United States Coast and Geodetic Survey, is shown in the plate on page 51.

The **Table-top** is a board of well-seasoned wood, panelled with the grain at right angles to prevent warping, and supported at a convenient height by a **Tripod** and **Levelling Head**.

The **Alidade** is a ruler of brass or steel supporting a telescope or sight standards, whose line of sight is parallel to a plane perpendicular to the lower side of the ruler, and embracing its fiducial edge.

The **Declinatoire** consists of a detached rectangular box containing a magnetic needle which moves over an arc of about 10° on each side of the 0.

* In preparing this section the writer has consulted, by permission, the treatise on the plane-table by Mr. E. Hergesheimer, contained in the report for 1880 of the U.S. Coast and Geodetic Survey.

Two spirit levels at right angles are attached to the ruler or to the declinatoire. In some instruments these are replaced by a circular level, or by a detached spring level.

The paper upon which the plot is to be made or completed is fastened evenly to the board by clamps, the surplus paper being loosely rolled under the sides of the board.

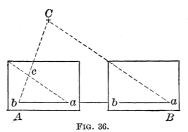

To place the table in position. This operation, which is sometimes called orienting the table, consists in placing the table so that the lines of the plot shall be parallel to the corresponding lines on the ground.

This may be accomplished approximately by turning the table until the needle of the declinatoire indicates the same bearing as at a previous station, the edge of the declinatoire coinciding with the same line on the paper at both stations.

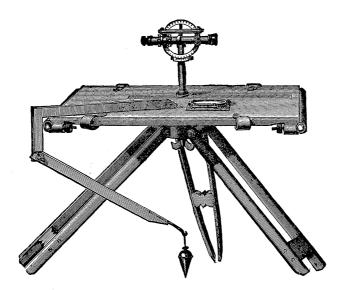

If, however, the line connecting the station at which the instrument is placed with another station is already plotted, the table may be placed in position accurately by placing it over the station so that the plotted line is by estimation over and in the direction of the line on the ground; then making the edge of the ruler coincide with the plotted line, and turning the board until the line of sight bisects the signal at the other end of the line on the ground.

To plot any point. Let ab on the paper represent the line AB on the ground; it is required to plot c, representing C on the ground.

1. By intersection.

Place the table in position at A (Fig. 36), plumbing a over A, and making the fiducial edge of the ruler pass through α ; turn the alidade about a until the line of sight bisects the signal at C, and draw a line along the fiducial edge of the ruler. Place the table in position at B, plumbing b over B, and repeat the operation just described. c will be the intersection of the two lines thus drawn.

THE PLANE-TABLE.

2. By resection.

Place the table in position at A (Fig. 37), and draw a line in the direction of C, as in the former case; then remove the instrument to C, place

it in position by the line drawn from a, make the edge of the ruler pass through b, and turn the alidade about b until B is in the line of sight. A line drawn along the edge of the ruler will intersect the line from a in c.

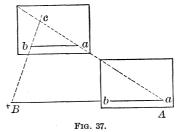

3. By radiation.

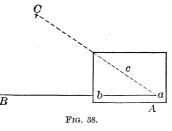

Place the table in position at A(Fig. 38), and draw a line from atoward C, as in the former cases. Measure AC, and lay off ac to the same scale as ab.

1. By radiation.

Set up the table at any point P, and mark p on the paper over P. Draw indefinite lines from p toward A, B, C Measure PA,

PB,, and lay off pa, pb,, to a suitable scale, and join a and b,

2. By progression.

b and c, c and d, etc.

Set up the table at A, and draw a line from a toward B. Measure AB, and plot ab to a suitable scale. Set up the table in position at B, and in like manner determine and plot bc, etc.

3. By intersection.

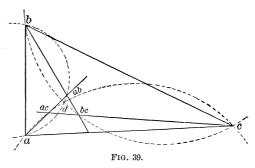

Plot one side as a base line. Plot the other corners by the method of intersection, and join.

4. By resection.

Plot one side as a base line. Plot the other corners by the method of resection, and join.

The Three Point Problem.

Let A, B, C represent three field stations plotted as a, b, c, respectively (Fig. 39); it is required to plot d representing a fourth field station D, visible from A, B, and C.

Place the table over D, level and orient approximately by the declinatoire. Determine d by resection as follows: Make the edge of the ruler pass through a and lie in the direction aA, and draw a line along the edge of the ruler. In like manner, draw lines through b toward B and through c toward C. If the table were oriented perfectly these lines would meet at the required point d, but ordinarily they will form the triangle of error, ab, ac, bc. In this case, through a, b, and ab; a, c, and ac; and b, c, and bc, respectively, draw circles; these circles will intersect in the required point d. For at the required point the sides ab, ac, bc must subtend the same angle as at the points ab, ac, bc, respectively. Hence, the required point d lies at the intersection of the three circles mentioned. The plane-table may now be oriented accurately.

Note. The three point problem may be solved by fastening on the board a piece of tracing paper and marking the point d representing D, after which lines are drawn from d toward A, B, and C. The tracing paper is then moved until the lines thus drawn pass through a, b, c, respectively, when by pricking through d the point is determined on the plot below.

CHAPTER III.

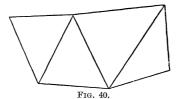

TRIANGULATION.*

§ 27. Introductory Remarks.

Geographical positions upon the surface of the earth are commonly determined by systems of triangles which connect a carefully determined base line with the points to be located.

Let F (Fig. 40) represent a point whose position with refer-

ence to the base line AB is required. Connect AB with F by the series of triangles ABC, ACD, ADE, and DEF, so that a signal at C is visible from A and B, a signal at D visible from A and C, a signal

at E visible from A and D, and a signal at F visible from D and E. In the triangle ABC, the side AB is known, and the angles at A and B may be measured; hence, AC may be computed. In the triangle ACD, AC is known, and the angles at A and C may be measured; hence, AD may be computed. In like manner DE and EF or DF may be determined. DF, or some suitable line connected with DF, may be measured, and this result compared with the computed value to test the accuracy of the field measurements.

* In preparing this chapter the writer has consulted, by permission, recent reports of the United States Coast and Geodetic Survey.

Three orders of triangulation are recognized, viz.:

Primary, in which the sides are from 20 to 150 miles in length.

Secondary, in which the sides are from 5 to 40 miles in length, and which connect the primary with the tertiary.

Tertiary, in which the sides are seldom over 5 miles in length, and which bring the survey down to such dimensions as to admit of the minor details being filled in by the compass and plane-table.

§ 28. The Measurement of Base Lines.

Base lines should be measured with a degree of accuracy corresponding to their importance.

Suitable ground must be selected and cleared of all obstructions. Each extremity of the line may be marked by cross lines on the head of a copper tack driven into a stub which is sunk to the surface of the ground. Poles are set up in line about half a mile apart, the alignment being controlled by a transit placed over one end of the line.

The preliminary measurement may be made with an iron wire about one-eighth of an inch in diameter and 60^m in length. In measuring, the wire is brought into line by means of a transit set up in line not more than one-fourth of a mile in the rear. The end of each 60^m is marked with pencil lines on a wooden bench whose legs are thrust into the ground after its position has been approximately determined. If the last measurement exceeds or falls short of the extremity of the line, the difference may be measured with the 20^m chain.

The final measurement is made with the base apparatus, which consists of bars 6^m long, which are supported upon trestles when in use. These bars are placed end to end, and brought to a horizontal position, if this can be quickly accomplished; if not, the angle of inclination is taken by a sector, or a vertical offset is measured with the aid of a transit, so that the exact horizontal distance can be computed.

A thermometer is attached to each bar, so that the temperature of the bar may be noted and a correction for temperature applied.

The method of measuring lines varies according to the required degree of accuracy in any particular case, but the brief description given above will give the student a general idea of the methods employed.

§ 29. The Measurement of Angles.

Angles are measured by the transit with much greater accuracy than by the compass, since the reading of the plates of the transit is taken to minutes, and by means of microscopes to seconds, while the reading of the needle of the compass is to quarter or half-quarter degrees.

In order to eliminate errors of observation, and errors arising from imperfect graduation of the circles, a large number of readings is made and their mean taken. Two methods are in use; viz., repetition and series.

The method of *repetition* consists, essentially, in measuring the angles about a point singly, then taking two adjacent angles as a single angle, then three, etc.; thus "closing the horizon," or measuring the whole angular magnitude about a point in several different ways.

The method of *series* consists, essentially, in taking the readings of an angle with the circle or limb of the transit in one position, then turning the circle through an arc and taking the readings of the same circle again, etc.; thus reading the angle from successive portions of the graduated circle.

On account of the curvature of the earth, the sum of the three angles of a triangle upon its surface exceeds 180°. This spherical excess, as it is called, becomes appreciable only when the sides of the triangle are about 5 miles in length. To determine the angles of the rectilinear triangle having the same vertices, one-third of the spherical excess is deducted from each spherical angle.

CHAPTER IV.

LEVELLING.

§ 30. DEFINITIONS, CURVATURE, AND REFRACTION.

A Level Surface is a surface parallel with the surface of still water; and is, therefore, slightly curved, owing to the spheroidal shape of the earth.

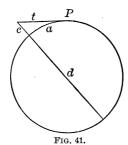

A Level Line is a line in a level surface.

Levelling is the process of finding the difference of level of two places, or the distance of one place above or below a level line through another place.

The Line of Apparent Level of a place is a tangent to the level line at that place. Hence, the line of apparent level is perpendicular to the plumb-line.

The Correction for Curvature is the deviation of the line of apparent level from the level line for any distance.

Let t (Fig. 41) represent the line of apparent level of the

place P, a the level line, d the diameter of the earth; then c represents the correction for curvature. To compute the correction for curvature:

$$t^2\!=\!c(c\!+\!d).\,(\text{Geom.}\,\S\,348.)$$
 Therefore, $c\!=\!\frac{t^2}{c+d}\!=\!\frac{a^2}{d}$

approximately, since c is very small compared with d, and t = a without appreciable error.

Since d is constant (=7920 miles, nearly), the correction for curvature varies as the square of the distance.

EXAMPLE. What is the correction for curvature for 1 mile? By substituting in the formula deduced above,

$$c = \frac{a^2}{d} = \frac{1^2}{7920}$$
 mi. = 8 in.

Hence, the correction for curvature for any distance may be found in inches, approximately, by multiplying 8 by the square of the distance expressed in miles.

Note. The effect of curvature is to make an object appear lower than it really is; and the effect of refraction of light, caused by the greater density of the atmosphere near the surface of the earth, is to make an object appear higher than it really is. When both effects are taken into account c is more correctly expressed by $c=\frac{5}{6}$ of $\frac{d^2}{d}$.

§ 31. THE Y LEVEL.

This instrument is shown on page 61.

The telescope is about 20 inches in length, and rests on supports called Y's, from their shape. The spirit level is underneath the telescope, and attached to it. The levelling-head and tripod are similar to the same parts of the transit.

§ 32. The Levelling Rod.

The two ends of the Philadelphia levelling rod are shown in Fig. 42. The rod is made of two pieces of wood, sliding upon each other, and held together in any position by a clamp.

The front surface of the rod is graduated to hundredths of a foot up to 7 feet. If a greater height than 7 feet is desired, the back part of the rod is moved up until the target is at the required height. When the rod is extended to full length, the front surface of the rear half reads from 7 to

Fig. 42

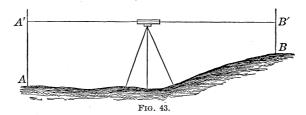

13 feet, so that the rod becomes a self-reading rod 13 feet long.

The target slides along the front of the rod, and is held in place by two springs which press upon the sides of the rod. It has a square opening at the centre, through which the division line of the rod opposite to the horizontal line of the target may be seen. It carries a vernier by which heights may be read to thousandths of a foot (§ 7).

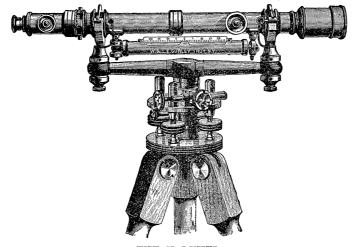

§ 33. Difference of Level.

To find the difference of level between two places visible from an intermediate place, when the difference of level does not exceed 13 feet.

Let A and B (Fig. 43) represent the two places. Set the Y level at a station equally distant, or nearly so, from A and

B, but not necessarily on the line AB. Place the legs of the tripod firmly in the ground, and level over each opposite pair of levelling screws, successively. Let the rodman hold the levelling rod vertically at A. Bring the telescope to bear upon the rod (§ 8), and by signal direct the rodman to move the target until its horizontal line is in the line of apparent level of the telescope. Let the rodman now record the height AA' of the target. In like manner find BB'. The difference between AA' and BB' will be the difference of level required. If the instrument be equally distant from A and B, or nearly so, the curvature and the refraction on the two sides of the instrument balance, and no correction for curvature or refraction will be necessary.

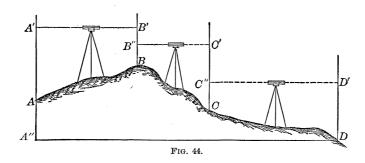

THE Y LEVEL.

If the instrument be set up at one station, and the rod at the other, the difference between the heights of the optical axis of the telescope and the target, corrected for curvature and refraction, will be the difference of level required.

To find the difference of level of two places, one of which cannot be seen from the other, and both invisible from the same place; or, when the two places differ considerably in level.

Let A and D (Fig. 44) represent the two places. Place the level midway between A and some intermediate station B.

Find AA' and BB', as in the preceding case, and record the former as a back-sight and the latter as a fore-sight. Select another intermediate station C, and in like manner find the back-sight BB'' and the fore-sight CC'; and so continue until the place D is reached.

The difference between the sum of the fore-sights and the sum of the back-sights will be the difference of level required.

For, the sum of the fore-sights

$$=BB'+CC'+DD'$$

= $BB''+B'B''+CC''+C'C''+DD'$.

The sum of the back-sights

$$=AA'+BB''+CC''.$$
 Hence, the difference
$$=B'B''+C'C''+DD'-AA'$$

$$=A'A''-AA'=AA''.$$

§ 34. Levelling for Section.

The intersection of a vertical plane with the surface of the earth is called a **Section** or **Profile**. The term profile, however, usually designates the **Plot** or representation of the section on paper.

Levelling for Section is levelling to obtain the data necessary for making a profile or plot of any required section.

A profile is made for the purpose of exhibiting in a single view the inequalities of the surface of the ground for great distances along the line of some proposed improvement, such as a railroad, canal, or ditch, and thus facilitating the establishment of the proper grades.

The data necessary for making a profile of any required section are, the heights of its different points above some assumed horizontal plane, called the **Datum Plane**, together with their horizontal distances apart or from the beginning of the section.

The position of the datum plane is fixed with reference to some permanent object near the beginning of the section, called a **Bench Mark**, and, in order to avoid negative heights, is assumed at such a distance below this mark that all the points of the section shall be above it.

The heights of the different points of the section above the datum plane are determined by means of the level and levelling-rod; and the horizontal length of the section is measured with an engineer's chain or tape, and divided into equal parts, one hundred feet in length, called **Stations**, marked by stakes numbered 0, 1, 2, 3, etc.

Where the ground is very irregular, it may be necessary, besides taking sights at the regular stakes, to take occasional sights at points between them. If, for instance, at a point sixty feet in advance of stake 8 there is a sudden rise or fall in the surface, the height of this point would be determined and recorded as at stake 8.60.

The readings of the rod are ordinarily taken to the nearest tenth of a foot, except on bench marks and points called turning points, where they are taken

to thousandths of a foot.

A Turning Point is a point on which the last sight is taken just before changing the position of the level, and the first sight from the new position of the instrument. A turning point may be coincident with one of the stakes, but must always be a hard point, so that the foot of the rod may stand at the same level for both readings.

To explain the method of obtaining the field notes necessary for making a profile, let 0, 1, 2, 3, 11 (Fig. 45) represent a portion of a section to be levelled and plotted. Establish a bench mark at or near the beginning of the line, measure the horizontal length of the section, and set stakes one hundred feet apart, numbering them 0, 1, 2, 3, etc. Place the level at some point, as between 2 and 3, and take the reading of the rod on the bench = 4.832. Let PP' represent the datum plane, say 15 feet below the bench mark, then

$$15 + 4.832 = 19.832$$

will be the height of the line of sight AB, called the **Height of the Instru-**

E Fig. 45.

ment, above the datum plane. Now take the reading at 0 = 5.2 = 0.4, and subtract the same from 19.832, which

leaves 14.6 = 0P, the height of the point 0 above the datum plane. Next take sights at 1, 2, 3, 3.40, and 4 equal respectively to 3.7, 3.0, 5.1, 4.8, and 8.3, and subtract the same from 19.832; the remainders 16.1, 16.8, 14.7, 15.0, and 11.5 will be the respective heights of the points 1, 2, 3, 3.40, and 4. Then, as it will be necessary to change the position of the instrument, select a point in the neighborhood of 4 suitable as a turning point (t.p. in the figure), and take a careful reading on it = 8.480; subtract this from 19.832, and the remainder, 11.352, will be the height of the turning point. Now carry the instrument forward to a new position, as between 5 and 6, shown in the figure, while the rodman remains at t.p.; take a second reading on t.p. = 4.102, and add it to 11.352, the height of t.p. above PP'; the sum 15.454 will be the height of the instrument CD in its new position. Now take sight upon 5, 6, and 7, equal respectively to 4.9, 2.8, and 0.904; subtract these sights from 15.454, and the results 10.6, 12.7, and 14.550 will be the heights of the points 5, 6, and 7 respectively. The point 7, being suitable, is made a turning point, and the instrument is moved forward to a point between 9 and 10. The sight at 7 = 6.870 added to the height of 7 gives 21.420 as the height of the instrument EF in its new position. The readings at 8, 9, 10, and 11, which are respectively 5.4, 3.6, 5.8, and 9.0, subtracted from 21.420, will give the heights of these points, namely, 16.0, 17.8, 15.6, and 12.4.

Proceed in like manner until the entire section is levelled, establishing bench marks at intervals along the line to serve as reference points for future operations.

As wind and bright sunshine affect the accuracy of levelling, for careful work a calm and cloudy day should be chosen; and great pains be taken to hold the rod vertical and to manipulate the level properly.

A record of the work described above is kept as follows:

STATION.	+ S.	H.I.	-s.	H.S.	REMARKS.
В	4.832			15.	Bench on rock 20 ft.
0.		19.832	5.2	14.6	south of 0.
1			3.7	16.1	**
2			3.0	16.8	
3			5.1	14.7	3 to 3.40 turnpike road.
3.40			4.8	15.0	
4			8.3	11.5	
t.p.	4.102		8.480	11.352	* 4
5		15.454	4.9	10.6	
6			2.8	12.7	
7	6.870	İ	0.904	14.550	
8		21.420	5.4	16.0	
9			3.6	17.8	
10			5.8	15.6	•
11			9.0	12.4	
\boldsymbol{B}		}			Bench on oak stump
12					27 ft. N.E. of 12,
etc.					etc.

The first column contains the numbers or names of all the points on which sights are taken. The second column contains the sight taken on the first bench mark, and the sight on each turning point taken immediately after the instrument has been moved to a new position. These are called Plus Sights (+ S.) because they are added to the heights of the points on which they are taken to obtain the height of the instrument given in the third column (H.I.). The fourth column contains all the readings except those recorded in the second column. These are called Minus Sights (-S.) because they are subtracted from the numbers in the third column to obtain all the numbers in the fifth column except the first, which is the assumed depth of the datum plane below the bench. The fifth column (H.S., height of surface) contains the required heights of all the points of the section named in the first column together with the heights of all benches and turning points.

To find the difference of level between any two points of the section, we have only to take the difference between the numbers in the fifth column opposite these points.

The real field notes are contained in the first, second, fourth, and last columns; the other columns may be filled after the field operations are completed. The field book may contain other columns; one for height of grade (H.G.), another for depth of cut (C.) and another for height of embankment or fill (F.).

To plot the section. Draw a line PP' (Fig. 45), to represent the datum plane, and beginning at some point as P, lay off the distances 100, 200, 300, 340, 400 feet, etc., to the right, using some convenient scale, say 200 feet to the inch. At these points of division erect perpendiculars equal in length to the height of the points 0, 1, 2, 3.40, 4, etc., given in the fifth column of the above field notes, using in this case a larger scale, say 20 feet to the inch. Through the extremities of these perpendiculars draw the irregular line $0, 1, 2, 3 \dots 11$, and the result, with some explanatory figures, will be the required plot or profile.

The making of a profile is much simplified by the use of profile paper, which may be had by the yard or roll.

If a horizontal plot is required, the bearings of the different portions of the section must be taken.

A plot should be made, if it will assist in properly understanding the field work, or if it is desirable for future reference in connection with the field notes.

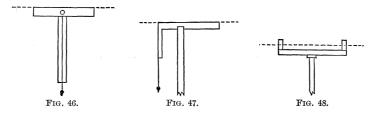

§ 35. Substitutes for the Y Level.

For many purposes not requiring accuracy, the following simple instruments in connection with a graduated rod will be found sufficient.

The Plumb Level (Fig. 46) consists of two pieces of wood joined at right angles. A straight line is drawn on the

upright perpendicular to the upper edge of the cross-head.

The instrument is fastened to a support by a screw through the centre of the cross-head. The upper edge of the crosshead is brought to a level by making the line on the upright coincide with a plumb-line.

A modified form is shown in Fig. 47. A carpenter's square is supported by a post, the top of which is split or sawed so as to receive the longer arm. The shorter arm is made vertical by a plumb-line which brings the longer arm to a level.

The Water Level is shown in Fig. 48. The upright tubes are of glass, cemented into a connecting tube of any suitable material. The whole is nearly filled with water, and supported at a convenient height. The surface of the water in the uprights determines the level.

By sighting along the upper surface of the block in which the **Spirit Level** is mounted for the use of mechanics, a level line may be obtained.

EXERCISE V.

- 1. Find the difference of level of two places from the following field notes: back-sights, 5.2, 6.8, and 4.0; fore-sights, 8.1, 9.5, and 7.9.
- 2. Write the proper numbers in the third and fifth columns of the following table of field notes, and make a profile of the section:

STATION.	+ S.	H.I.	-s.	H.S.	REMARKS.
В	6.944			20	Bench on post 22 ft.
0	}		7.4		north of 0.
1			5.6		
2			3.9		
3			4.6		
t.p.	3.855		5.513		
4			4.9

§ 36. Topographical Levelling.

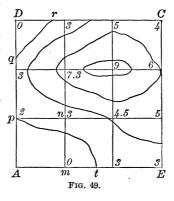

The principal object of topographical surveying is to show the contour of the ground. This operation, called topographical levelling, is performed by representing on paper the curved lines in which parallel horizontal planes at uniform distances apart would meet the surface.

It is evident that all points in the intersection of a horizontal plane with the surface of the ground are at the same level. Hence, it is only necessary to find points at the same level, and join these to determine a line of intersection.

The method commonly employed will be understood by a reference to Fig. 49. The ground ABCD is divided into equal squares, and a numbered stake driven at each intersection. By means of a level and levelling rod the heights of the other stations above m and D, the lowest stations, are determined. A plot of the ground with the intersecting lines is

then drawn, and the height of each station written as in the figure.

Suppose that the horizontal planes are 2 feet apart; if the first passes through m and D, q the second will pass through p, which is 2 feet above m; and since n is 3 feet above m, the second plane will cut the line mn in a point s determined by the proportion mn:ms::3:2. In like manner the points t, q, and r are determined.

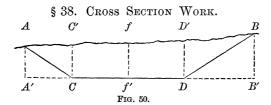

The irregular line tsp qr represents the intersection of the second horizontal plane with the surface of the ground. In like manner the intersections of the planes, respectively, 4, 6, and 8 feet above m are traced. The more rapid the change in level the nearer these lines will approach each other.

CHAPTER V.

RAILROAD SURVEYING.

§ 37. GENERAL REMARKS.

When the general route of a railroad has been determined, a middle surface line is run with the transit. A profile of this line is determined, as in § 34. The levelling stations are commonly 1 chain (100 feet) apart. Places of different level are connected by a gradient line, which intersects the perpendiculars to the datum line at the levelling stations in points determined by simple proportion. Hence, the distance of each levelling station, above or below the level or gradient line which represents the position of the road bed, is known.

Excavations. If the road bed lies below the surface, an excavation is made.

Let ACDB (Fig. 50) represent a cross section of an excavation, f a point in the middle surface line, f' the corresponding point in the road bed, and CD the width of the excavation at the bottom. The slopes at the sides are commonly made so that $AA' = \frac{2}{3}A'C$, and $BB' = \frac{2}{3}DB'$. ff' and CD being known, the points A, B, C', and D' are readily determined by a level and tape measure.

If from the area of the trapezoid ABB'A' the areas of the triangles AA'C and BB'D be deducted, the remainder will be the area of the cross section.

In like manner the cross section at the next station may be determined. These two cross sections will be the bases of a frustum of a quadrangular pyramid whose volume will be the amount of the excavation, approximately.

Embankments. If the road bed lies above the surface, an embankment is made, the cross section of which is like that of the excavation, but inverted.

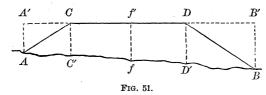

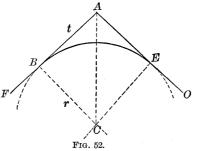

Fig. 51 represents the cross section of an embankment which is lettered so as to show its relation to Fig. 50.

§ 39. RAILROAD CURVES.

When it is necessary to change the direction of a railroad,

it is done gradually by a curve, usually the arc of a circle.

Let AF and AO (Fig. 52) represent two lines to be thus connected. Take any convenient distance AB = AE = t. The intersection of the perpendiculars BC and EC deter-

mines the centre C, and the radius of curvature BC = r. The length of the radius of curvature will depend on the angle A and the tangent AB. For, in the right triangle ABC,

$$\tan BAC = \frac{BC}{AB}$$
, or $\tan \frac{1}{2}A = \frac{r}{t}$.

Hence,
$$r = t \tan \frac{1}{2}A$$
.

The degree of a railroad curve is the angle subtended at the centre of the curve by a chord of 100 feet. If D is the degree of a curve and r its radius,

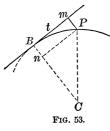

$$\sin \frac{1}{2}D = \frac{50}{r}$$
 and $r = 50 \csc \frac{1}{2}D$.

For example, a 6° curve has a radius of 955.37 feet.

To Lay out the Curve.

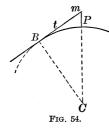

First Method. Let Bm (Fig. 53) represent a portion of the

tangent. It is required to find mP, the perpendicular to the tangent meeting the curve at P.

$$mP = Bn = CB - Cn.$$
 But
$$CD = r,$$
 and
$$Cn = \sqrt{\overline{CP^2 - \overline{Pn^2}}}$$

$$= \sqrt{r^2 - t^2}.$$
 Hence,
$$mP = r - \sqrt{r^2 - t^2}.$$

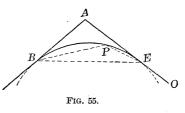

Second Method. It is required to find mP (Fig. 54) in the direction of the centre.

$$mP = mC - PC.$$
 But
$$mC = \sqrt{\overline{BC^2 + Bm^2}} = \sqrt{r^2 + t^2}.$$
 Hence,
$$mP = \sqrt{r^2 + t^2} - r.$$

Third Method. Place transits at B and E (Fig. 55). Direct

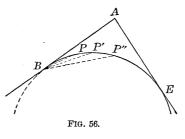

the telescope of the former to E, and of the latter to A. Turn each toward the curve the same number of degrees, and mark P, the point of intersection of the lines of sight. P will be a point in the circle to which AB and

AE are tangents at B and E, respectively.

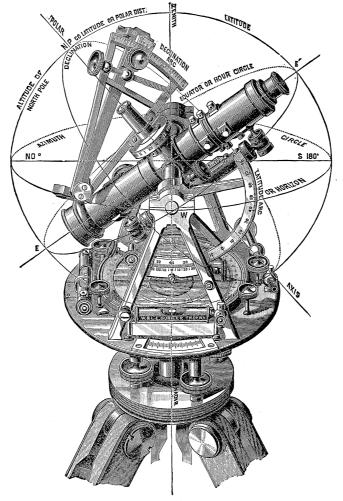

Fourth Method. If the degree D of the curve is given and

the tangent BA at B (Fig. 56), place the transit at B and direct toward A. Turn off successively the angles $ABP, PBP', P'BP'', \dots$ each equal to $\frac{1}{2}D$, and take DP, $PP', P'P'', \dots$ each 100 ft., the length of the tape. Then P, P', P'', \dots lie on the required curve.

If the angle A and the tangent distance BA = t are given, D can be found from the formulas

$$\sin \frac{1}{2}D = \frac{50}{r}$$
, $r = t \tan \frac{1}{2}A$, $\therefore \sin \frac{1}{2}D = \frac{50}{t} \cot \frac{1}{2}A$.

TRANSIT WITH SOLAR ATTACHMENT.

The circles shown in the cut are intended to represent in miniature circles supposed to be drawn upon the concave surface of the heavens.

ANSWERS.

PLANE TRIGONOMETRY.

Exercise I.

1.
$$60^{\circ} = \frac{\pi}{3}$$
, $45^{\circ} = \frac{\pi}{4}$, $150^{\circ} = \frac{5\pi}{6}$, $195^{\circ} = \frac{13\pi}{12}$, $11^{\circ} 15' = \frac{\pi}{16}$, $123^{\circ} 45' = \frac{11\pi}{16}$, $37^{\circ} 30' = \frac{5\pi}{24}$.

2.
$$\frac{2\pi}{3} = 120^{\circ}$$
, $\frac{3\pi}{4} = 135^{\circ}$, $\frac{5\pi}{8} = 112^{\circ} 30'$, $\frac{15\pi}{16} = 168^{\circ} 45'$, $\frac{7\pi}{15} = 84^{\circ}$.

3. $1^{\circ} = 0.0174533$ ·radian. 1' = 0.00029089 radian.

4. 1 radian = 206265''. 7. $14^{\circ} 27' 27''$.

10. 3 hr. 49 min. 11 sec.

 $5. \ \frac{3\pi}{4} \cdot \quad \frac{5\pi}{6} \cdot$

8. 69.167 miles. 11. 9 ft. 2 in.

6. 11° 27′ 33″.

9. 57 ft. 3.55 in.

12. $\frac{7}{165}$ sec.

Exercise II.

1.
$$\sin B = \frac{b}{c}$$
, $\cos B = \frac{a}{c}$, $\tan B = \frac{b}{a}$, $\cot B = \frac{a}{b}$, $\sec B = \frac{c}{a}$, $\csc B = \frac{c}{b}$

3. (i.)
$$\sin = \frac{3}{5}$$
, $\cos = \frac{4}{5}$, (ii.) $\sin = \frac{5}{13}$, etc. (v.) $\sin = \frac{39}{89}$, etc. $\tan = \frac{3}{4}$, $\cot = \frac{4}{3}$, (iii.) $\sin = \frac{3}{17}$, etc. (vi.) $\sin = \frac{119}{169}$, etc. $\sec = \frac{5}{4}$, $\csc = \frac{5}{3}$, (iv.) $\sin = \frac{9}{41}$, etc.

4. The required condition is that $a^2 + b^2 = c^2$. It is.

5. (i.)
$$\sin = \frac{2 mn}{m^2 + n^2}$$
, etc.
(ii.) $\sin = \frac{2 xy}{x^2 + y^2}$, etc.

(iii.)
$$\sin = \frac{q}{s}$$
, etc.

(ii.)
$$\sin = \frac{2 xy}{x^2 + y^2}$$
, etc.

(iv.)
$$\sin = \frac{ms}{qr}$$
, etc.

7. In (iii.) $p^2q^2 + q^2s^2 = p^2s^2$; in (iv.) $m^2n^2s^2 + m^2p^2v^2 = n^2q^2r^2$.

8.
$$c = 145$$
; whence, $\sin A = \frac{24}{145} = \cos B$; $\cos A = \frac{143}{143} = \sin B$; $\tan A = \frac{24}{143} = \cot B$; $\cot A = \frac{143}{24} = \tan B$; $\sec A = \frac{143}{143} = \csc B$; etc.

- 9. b = 0.023; whence, $\tan A = \cot B = \frac{2.64}{2.3}$; $\cot A = \tan B = \frac{2.3}{2.64}$, etc.
- 10. a = 16.8; whence, $\sin A = \frac{16.8}{19.3} = \cos B$, etc.
- 11. c = p + q; whence, $\sin A = \frac{\sqrt{p^2 + q^2}}{p + q} = \cos B$; etc.
- 12. $b = \sqrt{q(p+q)}$; whence, $\tan A = \sqrt{\frac{p}{q}} = \cot B$; etc.
- 13. a = p q; whence, $\sin A = \frac{p q}{p + q} = \cos B$; etc.
- 14. $\sin A = \frac{2}{5}\sqrt{5} = 0.89443$; etc.
- 15. $\sin A = \frac{2}{3}$; etc.
- 16. $\sin A = \frac{1}{8}(5 + \sqrt{7}) = 0.95572$; etc.
- 17. $\cos A = \frac{1}{8} (\sqrt{31} 1) = 0.57097$; $\sin A = \frac{1}{8} (\sqrt{31} + 1) = 0.82097$; etc.
- 18. a = 12.3.
- 20. a = 9.
- 22. c = 40.

- 19. b = 1.54.
- 21. b = 68.
- 23. c = 229.62.
- 24. Construct a rt. △ with legs equal to 3 and 2 respectively; then construct a similar △ with hypotenuse equal to 6.
 In like manner, 25, 26, 27, may be solved.
- 28. a = 1.5 miles; b = 2 miles.
- 31. 400,000 miles.
- 30. a = 0.342, b = 0.940; a = 1.368, b = 3.760.
- 32. 142.926 yards.

EXERCISE III.

- 5. Through A (Fig. 3) draw a tangent, and take AT=3; the angle AOT is the required angle.
- 6. From O (Fig. 3) as a centre, with a radius = 2, describe an arc cutting at T the tangent drawn through B; the angle AOT is the required angle.
- 7. In Fig. 3, take $OM = \frac{1}{2}$, and erect $MP \perp OA$ and intersecting the circumference at P; the angle POM is the required angle.
- 8. Since sin $x=\cos x$, OM=PM (Fig. 3), and $x=45^{\circ}$; hence, construct $x=45^{\circ}$.
- Construct a rt. △ with one leg = twice the other; the angle opposite
 the longer leg is the required angle.
- 10. Divide OA (Fig. 3) into four equal parts; at the first point of division from O erect a perpendicular to meet the circumference at some point P. Join OP; the angle AOP is the required angle.
- 21. $r \sin x$. 22. Leg adjacent to A = nc, leg opposite to A = mc.

ANSWERS.

44. (a - b) \sin x.
```

9

47. $a^2 + b^2 + 2ab \cos x$. 49. $\cos x \sin y - \sin x \cos y$.

48. 0. 50. $\tan x$.

51. Positive between $x = 0^{\circ}$ and $x = 135^{\circ}$, and between $x = 315^{\circ}$ and $x = 360^{\circ}$; negative between $x = 135^{\circ}$ and $x = 315^{\circ}$.

52. Positive between $x=45^{\circ}$ and $x=225^{\circ}$; negative between $x=0^{\circ}$ and $x = 45^{\circ}$, and between $x = 225^{\circ}$ and $x = 360^{\circ}$.

53. $\sin(x - 90^\circ) = -\cos x$, $\cos(x - 90^\circ) = \sin x$, etc.

54. $\sin (x - 180^\circ) = -\sin x$, $\cos (x - 180^\circ) = -\cos x$, etc.

Exercises 53 and 54 should be solved by drawing suitable figures, and employing a mode of proof similar to that used in § 24.

EXERCISE XIV.

- 1. $\sin(x+y) = \frac{56}{65}$, $\cos(x+y) = \frac{33}{65}$. 2. $\cos y$, $\sin y$.
- 3. $\sin(90^{\circ} + y) = \cos y$, $\cos(90^{\circ} + y) = -\sin y$, etc.
- 4. $\sin (180^{\circ} y) = \sin y$, $\cos (180^{\circ} y) = -\cos y$, etc.
- 5. $\sin (180^{\circ} + y) = -\sin y$, $\cos (180^{\circ} + y) = -\cos y$, etc.
- 6. $\sin (270^{\circ} y) = -\cos y$, $\cos (270^{\circ} y) = -\sin y$, etc.
- 7. $\sin (270^{\circ} + y) = -\cos y$, $\cos (270^{\circ} + y) = \sin y$, etc.
- 8. $\sin (360^{\circ} y) = -\sin y$, $\cos (360^{\circ} y) = \cos y$, etc.
- 9. $\sin (360^{\circ} + y) = \sin y$, $\cos (360^{\circ} + y) = \cos y$, etc.
- 10. $\sin(x 90^\circ) = -\cos x$, $\cos(x 90^\circ) = \sin x$, etc. 11. $\sin(x - 180^\circ) = -\sin x$, $\cos(x - 180^\circ) = -\cos x$, etc.
- 12. $\sin(x-270^\circ) = \cos x$, $\cos(x-270^\circ) = -\sin x$, etc.
- 13. $\sin(-y) = -\sin y$, $\cos(-y) = \cos y$, etc.
- 14. $\sin(45^{\circ}-y) = \frac{1}{2}\sqrt{2}(\cos y \sin y)$, $\cos(45^{\circ}-y) = \frac{1}{2}\sqrt{2}(\cos y + \sin y)$, etc.
- 15. $\sin(45^{\circ}+y) = \frac{1}{2}\sqrt{2}(\cos y + \sin y)$, $\cos(45^{\circ}+y) = \frac{1}{2}\sqrt{2}(\cos y \sin y)$, etc.
- 16. $\sin(30^{\circ}+y) = \frac{1}{2}(\cos y + \sqrt{3}\sin y)$, $\cos(30^{\circ}+y) = \frac{1}{2}\sqrt{3}(\cos y \sin y)$, etc.
- 17. $\sin(60^{\circ} y) = \frac{1}{2}(\sqrt{3}\cos y \sin y)$, $\cos(60^{\circ} y) = \frac{1}{2}(\cos y + \sqrt{3}\sin y)$, etc.
- 18. $3\sin x 4\sin^3 x$. 19. $4\cos^3 x - 3\cos x$.
- 22. $\sin \frac{1}{2}x = \sqrt{\frac{1 0.4\sqrt{6}}{2}} = 0.10051$; $\cos \frac{1}{2}x = \sqrt{\frac{1 + 0.4\sqrt{6}}{2}} = 0.99494$.
- 23. $\cos 2x = -\frac{1}{2}$, $\tan 2x = -\sqrt{3}$.

24.
$$\sin 22\frac{1}{2} = \frac{1}{2}\sqrt{2-\sqrt{2}} = 0.3827$$
, $\cos 22\frac{1}{2} = \frac{1}{2}\sqrt{2+\sqrt{2}} = 0.9239$. $\tan 22\frac{1}{2} = \sqrt{2} - 1 = 0.4142$, $\cot 22\frac{1}{2} = \sqrt{2} + 1 = 2.4142$.

25.
$$\sin 15^{\circ} = \frac{1}{2} \sqrt{2 - \sqrt{3}} = 0.25885$$
, $\cos 15^{\circ} = \frac{1}{2} \sqrt{2 + \sqrt{3}} = 0.96592$.
 $\tan 15^{\circ} = 2 - \sqrt{3} = 0.26799$, $\cot 15^{\circ} = 2 + \sqrt{3} = 3.7321$.

27-33. The truth of these equations is to be established by expressing the given functions in terms of the same function of the same angle. Thus, in Example 27,

$$\sin 2x = 2 \sin \cos x,$$
and
$$2 \tan x = 2 \frac{\sin x}{\cos x}, \quad 1 + \tan^2 x = \sec^2 x = \frac{1}{\cos^2 x}.$$

By making these substitutions in the given equation its truth will be evident.

34.
$$\sin A + \sin B + \sin C = \sin A + \sin B + \sin [180 - (A + B)]$$

 $= \sin A + \sin B + \sin (A + B)$
 $= 2 \sin \frac{1}{2}(A + B) \cos \frac{1}{2}(A - B) + 2 \sin \frac{1}{2}(A + B) \cos \frac{1}{2}(A + B)$
 $= 2 \sin \frac{1}{2}(A + B) [\cos \frac{1}{2}(A - B) + \cos \frac{1}{2}(A + B)]$
 $= 4 \sin \frac{1}{2}(A + B) \cos \frac{1}{2}A \cos \frac{1}{2}B,$ (see §§ 30 and 31).
But $\cos \frac{1}{2}C = \cos [90^{\circ} - \frac{1}{2}(A + B)] = \sin \frac{1}{2}(A + B).$
Therefore, $\sin A + \sin B + \sin C = 4 \cos \frac{1}{2}A \cos \frac{1}{2}B \cos \frac{1}{2}C.$

35. Proof similar to that for 34.

36.
$$\tan A + \tan B + \tan C$$

$$= \frac{\sin A \cos B}{\cos A \cos B} + \frac{\cos A \sin B}{\cos A \cos B} + \frac{\sin C}{\cos C}$$
$$= \frac{\sin C}{\cos A \cos B} + \frac{\sin C}{\cos C} = \frac{\sin C \cos C + \cos A \cos B \sin C}{\cos A \cos B \cos C}$$
$$= \frac{(\cos A \cos B + \cos C) \sin C}{\cos A \cos B \cos C} = \frac{[\cos A \cos B - \cos (A + B)] \sin C}{\cos A \cos B \cos C}$$
$$= \frac{\sin A \sin B \sin C}{\cos A \cos B \cos C} = \tan A \tan B \tan C.$$

37. Proof similar to that for 36.

 $\sin x \cos y$

38.
$$\frac{2}{\sin 2x}$$
 42. $\tan^2 x$. 46. $\frac{\cos(x+y)}{\sin x \sin y}$ 39. $2 \cot 2x$. 43. $\frac{\cos(x-y)}{\cos x \cos y}$ 47. $\tan x \tan y$.

 $\cos x \cos y$

41.
$$\frac{\cos(x+y)}{\sin x \cos y}$$
 45.
$$\frac{\cos(x-y)}{\sin x \sin y}$$

EXERCISE XV.

1.
$$\sin^{-1}\frac{1}{2}\sqrt{3} = 60^{\circ} + 2 n \pi$$
 or $120^{\circ} + 2 n \pi$.
 $\tan^{-1}\frac{1}{\sqrt{3}} = 30^{\circ} + 2 n \pi$ or $210^{\circ} + 2 n \pi$.

$$\text{vers}^{-1}\frac{1}{2} = \pm 60^{\circ} + 2 n \pi$$
.

$$\tan^{-1}\frac{1}{\sqrt{3}} = 30^{\circ} + 2n\pi \text{ or } 210^{\circ} + 2n\pi.$$

$$\text{vers}^{-1}\frac{1}{2} = \pm 60^{\circ} + 2n\pi.$$

$$\cos^{-1}\left(-\frac{1}{\sqrt{2}}\right) = 135^{\circ} + 2n\pi \text{ or } 225^{\circ} + 2n\pi.$$

$$\begin{array}{lll} \csc^{-1}\sqrt{2} &= 45^{\circ} + 2\,n\,\pi \ \ {\rm or} \ \ 135^{\circ} + 2\,n\,\pi. \\ \tan^{-1}\infty &= 90^{\circ} + 2\,n\,\pi \ \ {\rm or} \ \ 270^{\circ} + 2\,n\,\pi. \\ \sec^{-1}2 &= \pm\,60^{\circ} + 2\,n\,\pi. \end{array}$$

sec
$$12 = \pm 00^{\circ} + 2 n \pi$$
.
 $\cos^{-1}(-\frac{1}{2}\sqrt{3}) = 150^{\circ} + 2 n \pi \text{ or } 210^{\circ} + 2 n \pi$.
4. $\frac{1}{2\sqrt{2}}$.
 $10. \pm \frac{5}{13}$.
 $12. \pm \frac{1}{2}\sqrt{2}$.

4.
$$\frac{1}{2\sqrt{2}}$$

10.
$$\pm \frac{5}{13}$$

12.
$$\pm \frac{1}{2} \sqrt{2}$$

11.
$$\pm \frac{7}{24}$$

11.
$$\pm \frac{7}{24}$$
. 13. $x = 0$, or $\pm \frac{1}{2}\sqrt{3}$.

EXERCISE XVI.

- 1. If, for instance, $B = 90^{\circ}$,[25] becomes $\frac{a}{b} = \sin A$.
- 3. $a^2 = b^2 + c^2$, $a^2 = b^2 + c^2 2bc$, $a^2 = b^2 + c^2 + 2bc$.
- 6. 90° in each case.
- 7. (i.) $\frac{a-b}{a+b} = \tan{(A-45^{\circ})}$, and a right triangle.
 - (ii.) $a+b=(a-b)(2+\sqrt{3})$, an isosceles triangle with the angles 30°, 30°, 120°.

EXERCISE XVII.

9. 300.

- 15. a = 5, c = 9.6592.
- 10. AB = 59.564 miles. AC = 54.285 miles.
- 16. a = 7, b = 273.
- 11. 4.6064 miles, 4.4494 miles, 3.7733 miles.
- 1" Lues, 600 feet and 1039.2 feet; altitude, 519.6 feet.
- 12. 4.1501 and 8.67.
- 18. 855: 1607.
- 13. 6.1433 miles and 8.7918 miles. 20. 15.588.
- 19. 5.438 and 6.857.
- 14. 8 and 5.4728.

TRIGONOMETRY.

EXERCISE XVIII.

11. 420.

12. The other diagonal = 124.617.

EXERCISE XIX.

11. 6.

15. 25.

18. 10.266.

12. 10.392.

16. 3800 yards.

19. 5.0032 and 2.3385.

14. 8.9212.

17. 729.68 yards.

20. 26° 0′ 10″ and 14° 5′ 50″.

EXERCISE XX.

11. $A = 36^{\circ} 52' 12''$, $B = 53^{\circ} 7' 48''$, $C = 90^{\circ}$. 16. 45°, 60°, 75°.

12. $A = B = 33^{\circ} 33' 27''$, $C = 112^{\circ} 53' 6''$. 17. $4^{\circ} 23'$ W. of N., or W. of S.

13. $A = B = C = 60^{\circ}$.

18. 60°.

14. Impossible.

20. 0.88877.

15. 45°, 120°, 15°.

21. 54.516 miles.

EXERCISE XXI.

1. 4333600.

9. 17.3204

2. 365.68.

10. 10.3923

3. 13260.

11. 0.19952.

4. 8160.

12. $ab \sin A$.

13. $\frac{1}{4}(a^2-b^2)\tan A$.

5. 240.

14. 2421000.

6. 26208.

7. 15540.

15. 30°, 30°, 120°.

8. 29450 or 6983.

EXERCISE XXII.

1. 21.166 miles; 24.966 miles.

5. 20 feet.

2. 6.3399 miles.

6. 2.6247 or 21.4587

3. 119.29 feet.

7. 276.14 yards.

4. 30°.

8. 383.35 yards.

MISCELLANEOUS EXAMPLES.

PROBLEMS IN GONIOMETRY.

[The solutions here given are for angles less than 360°.]

- 79. $\pm \frac{1}{\sqrt{5}}, \pm \frac{2}{\sqrt{5}}$
- 80. $\pm \sqrt{5} 2$.
- 81. $\pm \frac{1}{2}\sqrt{5}$.
- 82. $\pm \frac{3}{5}$, $\pm \frac{4}{5}$.
- 83. $\pm \frac{4}{7}\sqrt{2}$.
- 84. $\frac{1}{2}$.
- 85. $\frac{\sqrt{5}-1}{4}, \frac{\sqrt{5}+1}{4}$.
- 86. $x = \frac{1}{2}\pi$, $\frac{3}{2}\pi$.
- 87. $x = 90^{\circ}$, 270°.
- 88. $x = \sin^{-1} \frac{\sqrt{3} 1}{2}$.
- 89. $x = 0^{\circ}, 90^{\circ}$.
- 90. $x = 30^{\circ}, \sin^{-1}(-\frac{1}{3}).$
- 91. $x = 180^{\circ}, \cos^{-1} \frac{5}{8}$.
- 92. $x = 0^{\circ}$, 120°, 180°, 240°.
- 93. $x = 45^{\circ}$, 225° , $\tan^{-1}(-\frac{1}{3})$.
- 94. $x = 0^{\circ}, \pm 60^{\circ}, \pm 120^{\circ}, 180^{\circ}$.
- 95. $x = -45^{\circ}$, 135°, $\frac{1}{2}\sin^{-1}(2\sqrt{2}-2)$.
- 96. $x = 0^{\circ}$, 45°, 180°, 225°.
- 97. $x = \cos^{-1}\left(\pm\sqrt{\frac{1}{\sqrt{2}}}\right)$
- 98. $x=0^{\circ},\ 45^{\circ},\ 90^{\circ},\ 180^{\circ},\ 225^{\circ},\ 120.$ $x=\pm\,30^{\circ},\ \pm\,90^{\circ},\ \pm\,150^{\circ}.$ 270°.
- 99. $x = 0^{\circ}$, 180° , $\frac{1}{2}\sin^{-1}\frac{8}{4}$.
- 100. $x = 0^{\circ}, \pm 90^{\circ}, \pm 120^{\circ}.$
- 101. $x = 0^{\circ}, \pm 36^{\circ}, \pm 72^{\circ}, \pm 108^{\circ}, 123. x = 0^{\circ}, \pm 45^{\circ}, \pm 135^{\circ}.$ $\pm 144^{\circ}$, 180°.

- 102. $x = \pm \frac{1}{6}\pi$, $\pm \frac{5}{6}\pi$.
- 103. $x = 0^{\circ}, \pm 60^{\circ}, \pm 120^{\circ}, 180^{\circ}.$
- 104. $x = \tan^{-1} \sqrt{2}$.
- 105. $x = -15^{\circ}$, 105°.
- 106. $x = -2 \cot^{-1} a$.
- 107. $x = \cos^{-1}\left(\frac{-a \pm \sqrt{a^2 + 8a + 8}}{4}\right)$
- 108. $x = -45^{\circ}$, 135°, $\frac{1}{2}\sin^{-1}(1-a)$.
- 109. $x = \pm 30^{\circ}, \pm 60^{\circ}, \pm 120^{\circ},$ $\pm 150^{\circ}$.
- 110. $x = \pm 60^{\circ}, \pm 90^{\circ}, \pm 120^{\circ}.$
- 111. $x = \pm 60^{\circ}, \pm 90^{\circ}, \pm 120^{\circ}.$
- 112. $x = 120^{\circ}$.
- 113. $x = 30^{\circ}, 150^{\circ}, \sin^{-1} \frac{1}{4}$.
- 114. $x = \pm 60^{\circ}, \pm 90^{\circ}.$
- 115. $x = 0^{\circ}, \pm 20^{\circ}, \pm 100^{\circ}, \pm 140^{\circ},$ $\pm 180^{\circ}$.
- 116. $x = \pm 45^{\circ}, \pm 90^{\circ}, \pm 135^{\circ}.$
- 117. $x = \pm 30^{\circ}, \pm 60^{\circ}, \pm 90^{\circ},$ $\pm 120^{\circ}, \pm 150^{\circ}.$
- 118. $x = 0^{\circ}, 45^{\circ}, \pm 90^{\circ}, 225^{\circ}.$
- 119. $x = \pm 30^{\circ}, \pm 60^{\circ}, \pm 120^{\circ},$ $\pm 150^{\circ}$.
- 121. $x = 0^{\circ}$, 45°, 180°, 225°.
- 122. $x = \pm 45^{\circ}$, $\pm 60^{\circ}$, $\pm 120^{\circ}$, \pm 135°.
- 124. $x = \pm 30^{\circ}, \pm 90^{\circ}, \pm 150^{\circ}.$

125.
$$x = 8^{\circ}$$
, 168° .

126. $x = \tan^{-1}\sqrt{\frac{1}{9}}$.

127. $x = \pm 30^{\circ}$.

128. $x = \pm 60^{\circ}$, $\pm 120^{\circ}$.

129. $x = \pm 30^{\circ}$, $\pm 60^{\circ}$, $\pm 120^{\circ}$, $\pm 150^{\circ}$.

130. $x = \pm \sin^{-1}\frac{4}{5}$.

131. $x = 30^{\circ}$, $150^{\circ} - \cos^{-1}\frac{1}{\sqrt[3]{2}}$.

132. $x = \tan^{-1}\frac{5}{12}$, $-\tan^{-1}\frac{3}{4}$.

133. $y = -90^{\circ}$, $x \text{ indeterminate}$; $x = 45^{\circ}$, $y = 180^{\circ}$; $x = 135^{\circ}$, $y = 180^{\circ}$; $x = 315^{\circ}$, $y = 180^{\circ}$.

134. $x = \tan^{-1}\frac{ab \pm \sqrt{a^2b^2 - 4ab}}{2b}$, 150. 4.

135. $x = 45^{\circ}$, 225° .

150. 4.

151. $\tan(x + y)$.

 $x = \tan^{-1}\frac{ab \pm \sqrt{a^2b^2 - 4ab}}{2b}$.

152. $\frac{\sin x}{\sin y}$.

153. $x = 45^{\circ}$, 225° .

154. $\tan^{-1}\frac{2x}{1 - 2x^2}$.

155. $x = \frac{1}{\sqrt{3}}$, $-\frac{1}{2}\sqrt{3}$.

156. $\cot^2 x - \tan^2 x$.

ENTRANCE EXAMINATION PAPERS.

6.

Exercise XXIII.

- 1. $\log_{10} 6 = 0.77815$. $\log_{10} 14 = 1.14613.$ $\log_{10} 21 = 1.32222$. $\log_{10} 4 = 0.60206.$ $\log_{10} 12 = 1.07918.$ $\log_{10} 5 \equiv 0.69897.$ $\log_{10}\frac{1}{4} = \overline{1}.39794.$ $\log_{10} \frac{1}{2} = \overline{1}.69897.$ $\log_{10} \frac{7}{9} = \overline{1}.89086.$ $\log_{10}\frac{21}{20} = 0.02119.$
- 2. $\log_2 10 = 3.3226$. $\log_2 5 = 2.3224.$ $\log_3 5 = 1.4650.$ $\log_7 \frac{1}{2} = -0.3562.$ $\log_{5\frac{9}{343}} = -2.3838.$
- $\log_e 3 = 1.09861.$ $\log_e 8 = 2.07944.$ $\log_e \frac{4}{5} = -0.22314.$ 3. $\log_e 2 = 0.69315$. $\log_e 5 = 1.60944.$ $\log_e 7 = 1.94591.$ $\log_e 9 = 2.19722.$ $\log_{e^{\frac{2}{3}}} = -0.40546.$ $\log_{e^{\frac{35}{27}}} = 0.25952.$
- $\log_{e^{\frac{7}{60}}} = -2.14843.$ 4. x = 1.5439. x = 0.83048.x = 0.42061.

EXERCISE XXIV.

- $\log_e 5 = 1.60944.$ $\log_e 7 = 1.94591.$ 1. $\log_e 3 = 1.09861$.
- 2. $\log_e 10 = 2.3025850930$.
- 3. $\log_{10} 2 = 0.30103$. $\log_{10}e = 0.43429.$ $\log_{10} 11 = 1.04139.$

EXERCISE XXV.

- 1. $\sin 1' = 0.00029088820$. $\cos 1' = 0.99999995769.$ $\tan 1' = 0.000290888012.$
- 6. 0° 40′ 9″ 2. $\sin 2' = 0.000581776$. 3. $\sin 1^{\circ} = 0.0174$.

EXERCISE XXVI.

- 1. $\sin 6' = 0.0017453$; $\cos 6' = 0.99999992$. 2. $\sin 2^{\circ} = 0.034902$; $\cos 2^{\circ} = 0.999392$
 - $\cos 3^{\circ} = 0.998632.$ $\sin 3^{\circ} = 0.052340$; $\sin 4^{\circ} = 0.069762$; $\cos 4^{\circ} = 0.997568.$

EXERCISE XXVII.

1. The 6 sixth roots of
$$-1$$
 are:
$$\frac{\sqrt{3}+i}{2}, \quad i, \quad \frac{-\sqrt{3}+i}{2}, \quad \frac{-\sqrt{3}-i}{2}, \quad -i, \quad \frac{\sqrt{3}-i}{2}.$$

The 6 sixth roots of +1 are:
1,
$$\frac{1+\sqrt{-3}}{2}$$
, $\frac{-1+\sqrt{-3}}{2}$, -1, $\frac{-1-\sqrt{-3}}{2}$, $\frac{1-\sqrt{-3}}{2}$.

2.
$$\frac{\sqrt{3}+i}{2}$$
, $\frac{-\sqrt{3}+i}{2}$, $-i$.

- 3. $\cos 67\frac{1}{2}^{\circ} + i \sin 67\frac{1}{2}^{\circ}$, $\cos 157\frac{1}{2}^{\circ} + i \sin 157\frac{1}{2}^{\circ}$, $\cos 247\frac{1}{2}^{\circ} + i \sin 247\frac{1}{2}^{\circ}$, $\cos 337\frac{1}{2}^{\circ} + i \sin 337\frac{1}{2}^{\circ}$.
- 4. $\sin 4\theta = 4\cos^3\theta \sin\theta 4\cos\theta \sin^3\theta$. $\cos 4\theta = \cos^4\theta 6\cos^2\theta \sin^2\theta + \sin^4\theta$.

EXERCISE XXVIII.

5.
$$\sec x = 1 + \frac{x^2}{2} + \frac{5x^4}{24} + \frac{61x^6}{720} + \cdots$$

6.
$$x \cot x = 1 - \frac{x^2}{3} - \frac{2x^4}{45} - \frac{11x^6}{1890} - \cdots$$

- 7. $\sin 10^{\circ} = 0.173648$, $\cos 10^{\circ} = 0.984808$.
- 8. $\tan 15^{\circ} = 0.267944$.

SPHERICAL TRIGONOMETRY.

EXERCISE XXIX.

- 1. 110°, 100°, 80°.
- 2. 140°, 90°, 55°.
- 7. $\frac{8}{9}\pi$, 2π , $\frac{25}{9}\pi$.

EXERCISE XXX.

- 3. (i.) Either a or b must be equal to 90°. (iii.) $A = 90^{\circ}$, B = b.
 - (ii.) $A = 90^{\circ} \text{ and } B = b$.
- (iv.) $c = 90^{\circ}$, $A = 90^{\circ}$, $B = 90^{\circ}$.

EXERCISE XXXI.

- 2. I. The cosine of the middle part = the product of the cotangents of the adjacent parts.
 - II. The cosine of the middle part = the product of the sines of the opposite parts.

EXERCISE XXXII.

- 24. $A = 175^{\circ}, 57', 10'', B = 135^{\circ}, 42', 50'', C = 135^{\circ}, 34', 7''$
- 25. $C = 104^{\circ} 41' 39''$, $a = 104^{\circ} 53' 2''$, $b = 133^{\circ} 39' 48''$.
- 26. $a = 90^{\circ}$; b and B are indeterminate.
- 27. $a = A = 60^{\circ}, b = 90^{\circ}, B = 90.$
- 28. The triangle is impossible.
- 29. $b = 130^{\circ} 41' 42''$, $c = 71^{\circ} 27' 43''$, $A = 112^{\circ} 57' 2''$.
- 30. $a = 26^{\circ} \text{ 3' 51''}, A = 35^{\circ}, B = 65^{\circ} 46' 7''.$
- 31. Impossible.

EXERCISE XXXIII.

- 1. $\cos A = \cot a \tan \frac{1}{2} b$, $\sin \frac{1}{2} B = \csc a \sin \frac{1}{2} b$, $\cos h = \cos a \sec \frac{1}{2} b$.
- 2. $\sin \frac{1}{2} A = \frac{1}{2} \sec \frac{1}{2} a$.
- 2. $\sin \frac{\pi}{2} A = \frac{\pi}{2} \sec \frac{\pi}{2} a$. 3. $\sin \frac{\pi}{2} A = \sec \frac{\pi}{2} a \cos \frac{180^{\circ}}{n}$, $\sin R = \sin \frac{\pi}{2} a \csc \frac{180^{\circ}}{n}$, $\sin\,r = \tan\,\tfrac{1}{2}\;\alpha\,\cot\,\frac{180^\circ}{n}\cdot$
- 4. Tetrahedron, $70^{\circ} 31' 46''$; octahedron, $109^{\circ} 28' 14''$; icosahedron, 138° 11′ 36″; cube, 90°; dodecahedron, 116° 33′ 44″.
- 5. $\cot \frac{1}{2} A = \sqrt{\cos a}$.

EXERCISE XXXV.

(ii.) $\tan m = \tan c \cos B$, 1. (i.) $\tan m = \tan b \cos A$, $\cos a = \cos b \sec m \cos (c - m);$ $\cos b = \cos c \sec m \cos (a - m).$

EXERCISE XXXVI.

(ii.) $\cot x = \tan C \csc b$, 1. (i.) $\cot x = \tan B \csc a$, $\cos A = \cos B \csc x \sin (C - x);$ $\cos B = \cos C \csc x \sin (A - x).$

EXERCISE XLI.

4. 2066.5 square miles.

EXERCISE XLII.

- 1. If x denotes the angle required, $\sin \frac{1}{2}x = \cos 18^{\circ}$ sec 9°, $x = 148^{\circ}$ 42′.
- 2. $\cos x = \cos A \cos B$.
- 3. Let w = the inclination of the edge c to the plane of a and b. Then it is easily shown that $V = abc \sin l \sin w$. Now, conceive a sphere constructed having for centre the vertex of the trihedral angle whose edges are a, b, c. The spherical triangle, whose vertices are the points where a, b, c meet the surface of this sphere, has for its sides l, m, n; and w is equal to the perpendicular arc from the side l to the opposite vertex. Let L, M, N denote the angles of this triangle. Then, by means of [39] and [48], we find that

$$\sin w = \sin m \sin N = 2 \sin m \sin \frac{1}{2} N \cos \frac{1}{2} N$$

$$= \frac{2}{\sin l} \sqrt{\sin s \sin (s - l) \sin (s - m) \sin (s - n)},$$

 $s = \frac{1}{2}(l + m + n);$ where

 $V = 2 abc \sqrt{\sin s \sin (s-l) \sin (s-m) \sin (s-n)}.$ hence,

- 4. (i.) 9,976,500 square miles; (ii.) 13,316,560 square miles.
- 5. Let m = longitude of point where the ship crosses the equator, B =her course at the equator, d = distance sailed. Then

 $\tan m = \sin l \tan a$, $\cos B = \cos l \sin a$, $\cot d = \cot l \cos a$.

- 6. Let k = arc of the parallel between the places, x = difference required;then $\sin \frac{1}{2} k = \sin \frac{1}{2} d \sec l$. $x = 90^{\circ} (\sqrt{2} - 1)$.
- 7. $\tan \frac{1}{2} (m m') = \sqrt{\sec s \sec (s d) \sin (s l) \sin (s l')}$; where 2 s = l+l'+d, and m and m' are the longitudes of the places.
- 9. 44 min. past 12 o'clock.

- 11. $\cos t = -\tan d \tan l$; time of sunrise = $12 \frac{t}{15}$ o'clock a.m.; time of sunset = $\frac{t}{15}$ o'clock p.m.; $\cos a = \sin d \sec l$. For longest day at Boston: time of sunrise, 4 hrs. 26 min. 50 sec. A.M.; time of sunset, 7 hrs. 33 min. 10 sec. p.m. Azimuth of sun at these times, 57° 25′ 15″; length of day, 15 hrs. 6 min. 20 sec.; for shortest day, times of sunrise and sunset are 7 hrs. 33 min. 10 sec. A.M. and $4~\mathrm{hrs.}\ 26~\mathrm{min.}\ 50~\mathrm{sec.}\ \mathrm{p.m.}$; azimuth of sun, $122^{\circ}\ 34^{\prime}\ 45^{\prime\prime}$; length of day, 8 hrs. 53 min. 40 sec.
- 12. The problem is impossible when $\cot d < \tan l$; that is, for places in the frigid zone.

- 13. For the northern hemisphere and positive declination, $\sin h = \sin l \sin d$, $\cot a = \cos l \tan d$. Example: $h = 17^{\circ} 14' 35''$, $a = 73^{\circ} 51' 34''$ E.
- 14. The farther the place from the equator, the greater the sun's altitude at 6 A.M. in summer. At the equator it is 0° . At the north pole it is equal to the sun's declination. At a given place, the sun's altitude at 6 A.M. is a maximum on the longest day of the year, and then $\sin h = \sin l \sin e$ (where $e = 23^{\circ} 27'$).
- 15. $\cos t=\cot l\tan d$. Times of bearing due east and due west are $12-\frac{t}{15}\,{\rm o'clock~a.m.,~and}\,\frac{t}{15}\,{\rm o'clock~p.m.,~respectively}.$

Example: 6 hrs. 58 min. A.M. and 5 hrs. 2 min. P.M.

- 16. When the days and nights are equal, $d=0^{\circ}$, $\cos t=0$, $t=90^{\circ}$; that is, sun is everywhere due east at 6 a.m., and due west at 6 a.m. Since l and d must both be less than 90° , $\cos t$ cannot be negative, therefore t cannot be greater than 90° . As d increases, t decreases; that is, the times in question both approach noon. If l < d, then $\cos t > 1$; therefore this case is impossible. If l = d, then $\cos t = 1$, and $t = 0^{\circ}$; that is, the times both coincide with noon. The explanation of this result is, that for d = l the sun at noon is in the zenith, and south of the prime vertical at every other time. And if l > d, the diurnal circle of the sun and the prime vertical of the place meet in two points which separate further and further as l increases. At the pole the prime vertical is indeterminate; but near the pole, $t = 90^{\circ}$, and the sun is always east at 6 a.m.
- 17. $\sin l = \sin d \csc h$. 18. 11° 50′ 35″.
- 19. The bearing of the wall, reckoned from the north point of the horizon, is given by the equation $\cot x = \cos l \tan d$; whence, for the given case, $x = 75^{\circ}$ 12′ 38″.
- 20. 55° 45′ 6″ N.
- 21. 63° 23′ 41″ N. or S.
- 22. (i.) $\cos t = -\tan l \cot p$; (ii.) t = z ; (iii.) the result is indeterminate.
- 23. $\cot a = \cos l \tan d$.
- 28. $\sin d = \sin e \sin u$, $\tan r = \cos e \tan u$.
- 25. $h = 65^{\circ} 37' 20''$.
- 29. $d = 32^{\circ} 24' 12'', r = 301^{\circ} 48' 17''.$
- 26. $h = 58^{\circ} 25' 15'', a = 152^{\circ} 28'.$ 30. $d = 20^{\circ} 48' 12''.$
- 27. $t = 45^{\circ} 42'$, $l = 67^{\circ} 58' 54''$. 31. 3 hrs. 59 min. 27_{3}^{2} sec. p.m.
- 32. $\cos \frac{1}{2} a = \sqrt{\cos \frac{1}{2} (l+h+p) \cos \frac{1}{2} (l+h-p) \sec l \sec h}$.

SURVEYING.

EXERCISE I.

 1. 8 A. 64 P.
 5. 3 A. 78 P.
 9. 13.0735.

 2. 29 A. $7\frac{3}{5}$ P.
 6. 13 A. $6\frac{1}{10}$ P.
 10. 2 A. $58\frac{1}{2}$ P.

 3. 4 A. $5\frac{3}{25}$ P.
 7. 11 A. 157 P.
 11. 4 A. 35 P.

 4. $115\frac{7}{20}$ P.
 8. 7.51925.

EXERCISE II.

- 1. 2 A. 26 P. 5. 8 A. 54 P. 8. 3 A. 122 P. 2. 20 A. 12 P. 6. 5 A. 42 P. 9. 6 A. 2 P. 3. 2 A. 54 P. 7. 2 A. 78 P. 10. 9 A. 40 P.
- 4. 2 a. 151 p.

EXERCISE III.

1. 2 A. $12\frac{1}{2}$ P. 2. 98 A. 92 P.

EXERCISE IV.

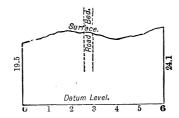

- 1. AE = 3.75 ch. 9. EM (on EA) = 2.5087 ch.; AN (on AB) = 6.439 ch.
 - EG = 3.42 ch. 10. Let EG > DF,
- 3. AE = 4.55 ch. 4. AE = 5.50 ch. 5. CE = 4.456 ch. AE = 12.247 ch. AG = 9.798 ch. AD = 8.659 ch.
- 6. AD = 2.275 ch.; AF = 6.928 ch. BE = 1.82 ch. 11. Let DG > EF, 7. AD = 4.51 ch.; CG = 14.862 ch.
- BE = 3.61 ch.8. The distances on AB are 2, 3, and 5 ch. then CC = 13.113 ch.CE = 11.404 ch.CE = 10.062 ch.

25

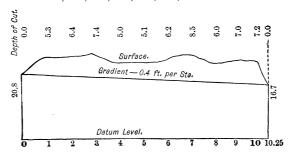

EXERCISE V.

1. 9.5 feet.

2. Third column: 26.944 opposite 0; 25.286 opposite 4. Fifth column: 20, 19.5, 21.3, 23, 22.3, 21.431, 20.4, 21.8, 24.1.

3. Column H. G. 20.8, 20.4, 20.0, 19.6, etc. Column C. 0.0, 5.3, 6.4, 7.4, 5.0, 5.1, etc.

FIVE-PLACE

LOGARITHMIC AND TRIGONOMETRIC

TABLES

ARRANGED BY

G. A. WENTWORTH, A.M.

AND

G. A. HILL, A.M.

Boston, U.S.A., AND LONDON
PUBLISHED BY GINN & COMPANY
1895

Entered according to Act of Congress, in the year 1882, by
G. A. WENTWORTH AND G. A. HILL
in the office of the Librarian of Congress at Washington

INTRODUCTION.

1. If the natural numbers are regarded as powers of ten, the exponents of the powers are the Common or Briggs Logarithms of the numbers. If A and B denote natural numbers, a and b their logarithms, then $10^a = A$, $10^b = B$; or, written in logarithmic form,

$$\log A = a$$
, $\log B = b$.

2. The logarithm of a product is found by adding the logarithms of its factors.

For,
$$A \times B = 10^a \times 10^b = 10^a + b$$
.
Therefore, $\log (A \times B) = a + b = \log A + \log B$.

3. The logarithm of a quotient is found by subtracting the logarithm of the divisor from that of the dividend.

For,
$$\frac{A}{B} = \frac{10^a}{10^b} = 10^a - b.$$
 Therefore,
$$\log \frac{A}{B} = a - b = \log A - \log B.$$

4. The logarithm of a power of a number is found by multiplying the logarithm of the number by the exponent of the power.

For,
$$A^n = (10^a)^n = 10^{an}$$
.
Therefore, $\log A^n = an = n \log A$.

5. The logarithm of the root of a number is found by dividing the logarithm of the number by the index of the root.

For,
$$\sqrt[n]{A} = \sqrt[n]{10^a} = 10^{\frac{a}{n}}.$$
 Therefore,
$$\log \sqrt[n]{A} = \frac{a}{n} = \frac{\log A}{n}.$$

6. The logarithms of 1, 10, 100, etc., and of 0.1, 0.01, 0.001, etc., are integral numbers. The logarithms of all other numbers are fractions.

```
For, 10^9 =
                                        10^{-1} = 0.1, hence \log 0.1 = -1;
             1, hence
                         \log 1 = 0;
     10^1 = 10, hence \log 10 = 1;
                                        10^{-2} = 0.01, hence \log 0.01 = -2;
     10^2 = 100, hence \log 100 = 2;
                                        10^{-3} = 0.001, hence \log 0.001 = -3;
     10^3 = 1000, hence \log 1000 = 3;
                                                    and so on.
If the number is between 1 and 10, the logarithm is between
If the number is between 10 and 100, the logarithm is between
If the number is between 100 and 1000, the logarithm is between
                                                                2 and 3.
If the number is between 1 and 0.1, the logarithm is between 0 and -1.
If the number is between 0.1 and 0.01, the logarithm is between -1 and -2.
If the number is between 0.01 and 0.001, the logarithm is between -2 and -3.
```

7. If the number is less than 1, the logarithm is negative (§ 6), but is written in such a form that the *fractional part* is always *positive*.

For the number may be regarded as the product of two factors, one of which lies between 1 and 10, and the other is a negative power of 10; the logarithm will then take the form of a difference whose minuend is a positive proper fraction, and whose subtrahend is a positive integral number.

```
Thus, 0.48 = 4.8 \times 0.1. Therefore (§ 2), \log 0.48 = \log 4.8 + \log 0.1 = 0.68124 - 1. (Page 1.) Again, 0.0007 = 7 \times 0.0001. Therefore, \log 0.0007 = \log 7 + \log 0.0001 = 0.84510 - 4. The logarithm 0.84510 - 4 is often written \overline{4}.84510.
```

8. Every logarithm, therefore, consists of two parts: a positive or negative integral number, which is called the **Characteristic**, and a *positive* proper fraction, which is called the **Mantissa**.

Thus, in the logarithm 3.52179, the integral number 3 is the characteristic, and the fraction .52179 the mantissa. In the logarithm 0.78254-2, the integral number -2 is the characteristic, and the fraction 0.78254 is the mantissa.

9. If the logarithm is *negative*, it is customary to change the form of the difference so that the subtrahend shall be 10 or a multiple of 10. This is done by adding to both minuend and subtrahend a number which will increase the subtrahend to 10 or a multiple of 10.

Thus, the logarithm 0.78254-2 is changed to 8.78254-10 by adding 8 to both minuend and subtrahend. The logarithm 0.92737-13 is changed to 7.92737-20 by adding 7 to both minuend and subtrahend.

10. The following rules are derived from § 6:—

If the number is greater than 1, make the characteristic of the logarithm one unit less than the number of figures on the left of the decimal point.

If the number is less than 1, make the characteristic of the logarithm negative, and one unit more than the number of zeros between the decimal point and the first significant figure of the given number.

If the characteristic of a given logarithm is *positive*, make the *number of figures* in the integral part of the corresponding number *one more* than the number of units in the characteristic.

If the characteristic is negative, make the number of zeros between the decimal point and the first significant figure of the corresponding number one less than the number of units in the characteristic.

```
Thus, the characteristic of \log 7849.27 = 3; the characteristic of \log 0.037 = -2 = 8.00000 - 10. the characteristic is 4, the corresponding number has five figures in
```

If the characteristic is 4, the corresponding number has five figures in its integral part. If the characteristic is -3, that is, 7.00000 - 10, the corresponding fraction has two zeros between the decimal point and the first significant figure.

11. The logarithms of numbers that can be derived one from another by multiplication or division by an integral power of 10 have the same mantissa.

For, multiplying or dividing a number by an integral power of 10 will increase or diminish its logarithm by the exponent of that power of 10; and since this exponent is an integer, the mantissa of the logarithm will be unaffected.

```
Thus, \begin{array}{ll} \log 4.6021 &= 0.66296. & (\mathrm{Page}\ 9.) \\ \log 460.21 &= \log \left(4.6021 \times 10^2\right) = \log 4.6021 + \log 10^2 \\ &= 0.66296 + 2 = 2.66296. \\ \log 460210 &= \log \left(4.6021 \times 10^5\right) = \log 4.6021 + \log 10^5 \\ &= 0.66296 + 5 = 5.66296. \\ \log 0.046021 = \log \left(4.6021 \div 10^2\right) = \log 4.6021 - \log 10^2 \\ &= 0.66296 - 2 = 8.66296 - 10. \end{array}
```

TABLE I.

12. In this table (pp. 1–19) the vertical columns headed N contain the numbers, and the other columns the logarithms. On page 1 both the characteristic and the mantissa are printed. On pages 2–19 the mantissa only is printed.

The fractional part of a logarithm can be expressed only approximately, and in a five-place table all figures that follow the fifth are rejected. Whenever the sixth figure is 5, or more, the fifth figure is increased by 1. The figure $\underline{5}$ is written when the value of the figure in the place in which it stands, together with the succeeding figures, is more than $4\frac{1}{2}$, but less than 5.

Thus, if the mantissa of a logarithm written to seven places is 5328732, it is written in this table (a five-place table) 53287. If it is 5328751, it is written 53288. If it is 5328461 or 5328499, it is written in this table 53285.

Again, if the mantissa is 5324981, it is written $532\underline{5}0$; and if it is 4999967, it is written $\underline{5}0000$.

This distinction between 5 and 5, in case it is desired to curtail still further the mantissas of logarithms, removes all doubt whether a 5 in the last given place, or in the last but one followed by a zero, should be simply rejected, or whether the rejection should lead us to increase the preceding figure by one unit.

Thus, the mantissa $1392\underline{5}$ when reduced to four places should be 1392; but 13925 should be 1393.

TO FIND THE LOGARITHM OF A GIVEN NUMBER.

- 13. If the given number consists of one or two significant figures, the logarithm is given on page 1. If zeros follow the significant figures, or if the number is a proper decimal fraction, the characteristic must be determined by § 10.
- 14. If the given number has three significant figures, it will be found in the column headed N (pp. 2–19), and the mantissa of its logarithm in the next column to the right, and on the same line. Thus,

```
\begin{array}{lll} \text{Page} & 2. & \log 145 = 2.16137, & \log 14500 = 4.16137. \\ \text{Page} & 14. & \log 716 = 2.85491, & \log 0.716 = 9.85491 - 10. \end{array}
```

15. If the given number has four significant figures, the first three will be found in the column headed N, and the fourth at the top of the page in the line containing the figures 1, 2, 3, etc. The mantissa will be found in the column headed by the fourth figure, and on the same line with the first three figures. Thus,

16. If the given number has five or more significant figures, a process called interpolation is required.

Interpolation is based on the assumption that between two consecutive mantissas of the table the change in the mantissa is directly proportional to the change in the number.

Required the logarithm of 34237.

The required mantissa is (§ 11) the same as the mantissa for 3423.7; therefore it will be found by adding to the mantissa of 3423 seven-tenths of the difference between the mantissas for 3423 and 3424.

The mantissa for 3423 is 53441.

The difference between the mantissas for 3423 and 3424 is 12.

Hence, the mantissa for 3423.7 is $53441 + (0.7 \times 12) = 53449$.

Therefore, the required logarithm of 34237 is 4.53449.

Required the logarithm of 0.0015764.

The required mantissa is the same as the mantissa for 1576.4; therefore it will be found by adding to the mantissa for 1576 four-tenths of the difference between the mantissas for 1576 and 1577.

The mantissa for 1576 is 19756.

The difference between the mantissas for 1576 and 1577 is 27.

Hence, the mantissa for 1576.4 is $19756 + (0.4 \times 27) = 19767$.

Therefore, the required logarithm of 0.0015764 is 7.19767 - 10.

Required the logarithm of 32.6708.

The required mantissa is the same as the mantissa for 3267.08; therefore it will be found by adding to the mantissa for 3267 eight-hundredths of the difference between the mantissas for 3267 and 3268.

The mantissa for 3267 is 51415.

The difference between the mantissas for 3267 and 3268 is 13.

Hence, the mantissa for 3267.08 is $51415 + (0.08 \times 13) = 51416$.

Therefore, the required logarithm of 32.6708 is 1.51416.

17. When the fraction of a unit in the part to be added to the mantissa for four figures is less than 0.5 it is to be neglected; when it is 0.5 or more than 0.5 it is to be taken as one unit.

Thus, in the first example, the part to be added to the mantissa for 3423 is 8.4, and the .4 is rejected. In the second example, the part to be added to the mantissa for 1576 is 10.8, and 11 is added.

TO FIND THE ANTILOGARITHM; THAT IS, THE NUMBER CORRESPONDING TO A GIVEN LOGARITHM.

18. If the given mantissa can be found in the table, the first three figures of the required number will be found in the same line with the mantissa in the column headed N, and the fourth figure at the top of the column containing the mantissa.

The position of the decimal point is determined by the characteristic (§ 10).

Find the number corresponding to the logarithm 0.92002.

Page 16. The number for the mantissa 92002 is 8318.

The characteristic is 0; therefore, the required number is 8.318.

Find the number corresponding to the logarithm 6.09167.

Page 2. The number for the mantissa 09167 is 1235.

The characteristic is 6; therefore, the required number is 1235000.

Find the number corresponding to the logarithm 7.50325 - 10.

Page 6. The number for the mantissa 50325 is 3186.

The characteristic is -3; therefore, the required number is 0.003186.

19. If the given mantissa cannot be found in the table, find in the table the two adjacent mantissas between which the given mantissa lies, and the four figures corresponding to the smaller of these two mantissas will be the first four significant figures of the required number. If more than four figures are desired, they may be found by interpolation, as in the following examples:

Find the number corresponding to the logarithm 1.48762.

Here the two adjacent mantissas of the table, between which the given mantissa 48762 lies, are found to be (page 6) 48756 and 48770. The corresponding numbers are 3073 and 3074. The smaller of these, 3073, contains the first four significant figures of the required number.

The difference between the two adjacent mantissas is 14, and the difference between the corresponding numbers is 1.

The difference between the smaller of the two adjacent mantissas, 48756, and the given mantissa, 48762, is 6. Therefore, the number to be annexed to 3073 is $\frac{6}{14}$ of 1=0.428, and the fifth significant figure of the required number is 4.

Hence, the required number is 30.734.

Find the number corresponding to the logarithm 7.82326 - 10.

The two adjacent mantissas between which 82326 lies are (page 13) 82321 and 82328. The number corresponding to the mantissa 82321 is 6656.

The difference between the two adjacent mantissas is 7, and the difference between the corresponding numbers is 1.

The difference between the smaller mantissa, 82321, and the given mantissa, 82326, is 5. Therefore, the number to be annexed to 6656 is $\frac{5}{7}$ of 1=0.7, and the fifth significant figure of the required number is 7.

Hence, the required number is 0.0066567.

In using a five-place table the numbers corresponding to mantissas may be carried to five significant figures, and in the first part of the table to six figures.*

20. The logarithm of the reciprocal of a number is called the Cologarithm of the number.

If A denotes any number, then

$$\operatorname{colog} A = \log \frac{1}{A} = \log 1 - \log A \, (\$ \, 3) = -\log A.$$

Hence, the cologarithm of a number is equal to the logarithm of the number with the minus sign prefixed, which sign affects the entire logarithm, both characteristic and mantissa.

*In most tables of logarithms proportional parts are given as an aid to interpolation; but, after a little practice, the operation can be performed nearly as rapidly without them. Their omission allows a page with larger-faced type and more open spacing, and consequently less trying to the eyes.

In order to avoid a negative mantissa in the cologarithm, it is customary to substitute for $-\log A$ its equivalent

$$(10 - \log A) - 10.$$

Hence, the cologarithm of a number is found by subtracting the logarithm of the number from 10, and then annexing -10 to the remainder.

The best way to perform the subtraction is to begin on the left and subtract each figure of $\log A$ from 9 until we reach the last significant figure, which must be subtracted from 10.

If $\log A$ is greater in absolute value than 10 and less than 20, then in order to avoid a negative mantissa, it is necessary to write $-\log A$ in the form

$$(20 - \log A) - 20.$$

So that, in this case, colog A is found by subtracting $\log A$ from 20, and then annexing -20 to the remainder.

Find the cologarithm of 4007.

Page 8.
$$\log 4007 = \frac{10 - 10}{3.60282}$$
$$\operatorname{colog} 4007 = \frac{3.60282}{6.39718 - 10}$$

Find the cologarithm of 103992000000.

Page 2.
$$\log 103992000000 = \frac{20 - 20}{11.01700}$$

 $\operatorname{colog} 103992000000 = \frac{8.98300 - 20}{10000000000}$

If the characteristic of $\log A$ is negative, then the subtrahend, -10 or -20, will vanish in finding the value of colog A.

Find the cologarithm of 0.004007.

$$\begin{array}{c} 10 & -10 \\ \log 0.004007 = \begin{array}{c} 7.60282 - 10 \\ \text{colog } 0.004007 = \end{array} \end{array}$$

With practice, the cologarithm of a number can be taken from the table as rapidly as the logarithm itself.

By using cologarithms the inconvenience of subtracting the logarithm of a divisor is avoided. For dividing by a number is equivalent to multiplying by its reciprocal. Hence, instead of subtracting the logarithm of a divisor its cologarithm may be added.

EXERCISES.

Find the logarithms of:

1.	6170.	4.	85.76.	7.	0.8694.	10.	67.3208.
2.	0.617.	5.	296.8.	8.	0.5908.	11.	18.5283.
3.	2867.	6.	7004.	9.	73243.	12.	0.0042003.

Find the cologarithms of:

13.	72433.	16.	869.278.	19.	0.002403.
14.	802.376.	17.	154000.	20.	0.000777.
15.	15.7643.	18	70.0426.	21.	0.051828.

Find the antilogarithms of:

22.	2.47246.	25.	1.26784.	28.	9.79029 - 10.
2 3.	7.89081.	26.	3.79029.	29.	7.62328 - 10.
24.	2.91221.	27.	5.18752.	30.	6.15465 - 10.

COMPUTATION BY LOGARITHMS.

21. (1) Find the value of x, if $x = 72214 \times 0.08203$.

```
Page 14.\log 72214 = 4.85862Page 16.\log 0.08203 = 8.91397 - 10By § 2.\log x = 3.77259Page 11.x = 5923.63
```

(2) Find the value of x, if $x = 5250 \div 23487$.

```
Page 10.\log 5250= 3.72016Page 4.\operatorname{colog} 23487= \underline{5.62917 - 10}Page 4.\log x= \underline{9.34933 - 10} = \log 0.22353\therefore x= 0.22353
```

(3) Find the value of x, if $x = \frac{7.56 \times 4667 \times 567}{899.1 \times 0.00337 \times 23435}$.

```
Page 15.
               \log 7.56
                            = 0.87852
Page 9.
               \log 4667 = 3.66904
               \log 567
Page 11.
                            = 2.75358
Page 17.
              colog 899.1 = 7.04619 - 10
Page 6.
              colog 0.00337 = 2.47237
              colog 23435 = \underline{5.63013 - 10}
Page 4.
                            =\overline{2.44983} = \log 281.73
Page 5.
                \log x
                            = 281.73.
                 \therefore x
```

(4) Find the cube of 376.

Page 7.
$$\log 376$$
 = 2.57519
Multiply by 3 (§ 4), 3
Page 10. $\log 376^3$ = $7.72557 = \log 53158600$
 $\therefore 376^3$ = 53158600.

(5) Find the square of 0.003278.

Page 6.
$$\log 0.003278 = 7.51561 - 10$$

Page 2. $\log 0.003278^2 = \frac{2}{15.03122 - 20} = \log 0.000010745$
 $0.003278^2 = 0.000010745$.

(6) Find the square root of 8322.

Page 16. log 8322 = 3.92023
Divide by 2 (§ 5), 2)3.92023
log
$$\sqrt{8322}$$
 = 1.96012 = log 91.226
 $\therefore \sqrt{8322}$ = 91.226.

If the given number is a proper fraction, its logarithm will have as a subtrahend 10 or a multiple of 10. In this case, before dividing the logarithm by the index of the root, both the subtrahend and the number preceding the mantissa should be increased by such a number as will make the subtrahend, when divided by the index of the root, 10 or a multiple of 10.

(7) Find the square root of 0.000043641.

Page 8.
$$\log 0.000043641 = 5.63989 - 10$$

 $10 - 10$
Divide by 2 (§ 5), $2 \sqrt{15.63989 - 20}$
Page 13. $\log \sqrt{0.000043641} = 7.81995 - 10 = \log 0.0066062$
 $\therefore \sqrt{0.000043641} = 0.0066062$.

(8) Find the sixth root of 0.076553.

Page 15.
$$\log 0.076553$$
 = 8.88397 - 10
50 - 50
6)58.88397 - 60
Page 13. $\log \sqrt[6]{0.076553}$ = 9.81400 - 10 = $\log 0.65163$
 $\therefore \sqrt[6]{0.076553}$ = 0.65163.

Exercises.

Find by logarithms the value of:

1.
$$\frac{45607}{31045}$$
. 2. $\frac{5.6123}{0.01987}$. 3. $\frac{2.567}{0.05786}$

4.
$$\frac{0.06547}{74.938 \times 0.05938}$$

5.
$$\frac{4.657 \times 0.03467}{3.908 \times 0.07189}$$
.

6.
$$\frac{0.0075389 \times 0.0079}{0.00907 \times 0.009784}$$

7.
$$\frac{312 \times 7.18 \times 31.82}{519 \times 8.27 \times 5.132}$$

8.
$$\frac{0.007 \times 57.83 \times 28.13}{9.317 \times 00.28 \times 476.5}$$

9.
$$\frac{5.55 \times 0.0007632 \times 0.87654}{2.79 \times 0.0009524 \times 1.46785}$$

10.
$$\sqrt{\frac{0.003457 \times 43.387 \times 99.2 \times 0.00025}{0.005824 \times 15.724 \times 1.38 \times 0.00089}}$$

11.
$$\sqrt[3]{\frac{23.815 \times 29.36 \times 0.007 \times 0.62487}{0.00072 \times 9.236 \times 5.924 \times 3.0007}}$$

12.
$$\sqrt{\frac{3.1416 \times 0.031416 \times 0.0031416}{1.7285 \times 0.017285 \times 0.0017285}}$$

TABLE II.

22. This table (page 20) contains the value of the number π , its most useful combinations, and their logarithms.

Find the length of an arc of 47° 32′ 57″ in a unit circle.

$$47^{\circ} \ 32' \ 57'' = 171177''$$

$$\log 171177 = 5.23344$$

$$\log \frac{1}{a''} = 4.68557 - 10$$

$$\log \operatorname{arc} \ 47^{\circ} \ 32' \ 57'' = 9.91901 - 10 = \log 0.82994$$

$$\therefore \operatorname{length} \ \operatorname{of} \ \operatorname{arc} = 0.82994.$$

Find the angle if the length of its arc in a unit circle = 0.54936.

log 0.54936 = 9.73986 − 10
colog
$$\frac{1}{a''}$$
 = log a'' = 5.31443
log angle = $\frac{1}{5.05429}$ = log 113316
∴ angle = 113316" = 31° 28′ 36".

23. The relations between arcs and angles given in Table II. are readily deduced from the circular measure of an angle.

In Circular Measure an angle is defined by the equation

$$angle = \frac{arc}{radius}$$

in which the word are denotes the length of the arc corresponding to the angle, when both arc and radius are expressed in terms of the same linear unit.

Since the arc and radius for a given angle in different circles vary in the same ratio, the value of the angle given by this equation is independent of the value of the radius.

The angle which is measured by a radius-arc is called a Radian, and is the angular unit in circular measure.

Since
$$C = 2 \pi R$$
, it follows that $\frac{C}{R} = 2 \pi$, and $\frac{\frac{1}{2} C}{R} = \pi$. Therefore,

If the arc = circumference, the angle = 2π .

If the arc = semicircumference, the angle = π .

If the arc = quadrant, the angle = $\frac{1}{2}\pi$.

If the arc = radius, the angle = 1.

Therefore, $\pi = 180^{\circ}$, $\frac{1}{2}\pi = 90^{\circ}$, $\frac{1}{3}\pi = 60^{\circ}$, $\frac{1}{4}\pi = 45^{\circ}$, $\frac{1}{6}\pi = 30^{\circ}$, $\frac{1}{8}\pi = 22\frac{1}{8}^{\circ}$, and so on.

Since 180° in common measure equals π units in circular measure,

1° in common measure $=\frac{\pi}{180}$ units in circular measure;

1 unit in circular measure $=\frac{180^{\circ}}{\pi}$ in common measure.

By means of these two equations, the value of an angle expressed in one measure may be changed to its value in the other measure.

Thus, the angle whose arc is equal to the radius is an angle of 1 unit in circular measure, and is equal to $\frac{180^{\circ}}{\pi}$, or 57° 17′ 45″, very nearly.

TABLE III.

24. This table (pp. 21–49) contains the logarithms of the trigonometric functions of angles. In order to avoid negative characteristics, the characteristic of every logarithm is printed 10 too large. Therefore, -10 is to be annexed to each logarithm.

On pages 28–49 the characteristic remains the same throughout each column, and is printed at the top and the bottom of the column.

But on pp. 30, 49, the characteristic changes one unit in value at the places marked with bars. Above these bars the proper characteristic is printed at the top, and below them at the bottom, of the column.

25. On pages 28–49 the log sin, log tan, log cot, and log cos, of 1° to 89°, are given to every minute. Conversely, this part of the table gives the value of the angle to the nearest minute when log sin, log tan, log cot, or log cos is known, provided log sin or log cos lies between 8.24186 and 9.99993, and log tan or log cot lies between 8.24192 and 11.75808.

If the exact value of the given logarithm of a function is not found in the table, the value nearest to it is to be taken, unless interpolation is employed as explained in § 26.

If the angle is less than 45° the number of degrees is printed at the top of the page, and the number of minutes in the column to the left of the columns containing the logarithm. If the angle is greater than 45°, the number of degrees is printed at the bottom of the page, and the number of minutes in the column to the right of the columns containing the logarithms.

If the angle is less than 45°, the names of its functions are printed at the top of the page; if greater than 45°, at the bottom of the page. Thus,

```
Page 38. \log \sin 21^{\circ} 37' = 9.56631 - 10.

Page 45. \log \cot 36^{\circ} 53' = 10.12473 - 10 = 0.12473.

Page 37. \log \cos 69^{\circ} 14' = 9.54969 - 10.

Page 49. \log \tan 45^{\circ} 59' = 10.01491 - 10 = 0.01491.

Page 48. If \log \cos = 9.87468 - 10, angle = 41^{\circ} 28'.

Page 34. If \log \cot = 9.39353 - 10, angle = 76^{\circ} 6'.

If \log \sin = 9.47760 - 10, the nearest \log \sin in the table is 9.47774 - 10 (page 36), and the angle corresponding to this value is 17^{\circ} 29'.
```

If $\log \tan = 0.76520 = 10.76520 - 10$, the nearest $\log \tan$ in the table is 10.76490 - 10 (page 32), and the angle corresponding to this value is 80° 15′.

26. If it is desired to obtain the logarithms of the functions of angles that contain seconds, or to obtain the value of the angle in degrees, minutes, and seconds, from the logarithms of its functions, interpolation must be employed. Here it must be remembered that,

The difference between two consecutive angles in the table is 60".

Log sin and log tan increase as the angle increases; log cos and log cot diminish as the angle increases.

Find log tan 70° 46′ 8″.

Page 37. $\log \tan 70^{\circ} 46' = 0.45731$.

The difference between the mantissas of log tan 70° 46′ and log tan 70° 47′ is 41, and $\frac{8}{00}$ of 41 = 5.

As the function is increasing, the 5 must be added to the figure in the fifth place of the mantissa 45731; and

Therefore log tan 70° 46′ 8″ = 0.45736.

Find log cos 47° 35' 4''.

Page 48. $\log \cos 47^{\circ} 35' = 9.82899 - 10.$

The difference between this mantissa and the mantissas of the next log cos is 14, and $\frac{4}{60}$ of 14 = 1.

As the function is decreasing, the 1 must be subtracted from the figure in the fifth place of the mantissa 82899; and

Therefore $\log \cos 47^{\circ} 35' 4'' = 9.82898 - 10$.

Find the angle for which $\log \sin = 9.45359 - 10$.

Page 35. The mantissa of the nearest smaller log sin in the table is 45334.

The angle corresponding to this value is 16° 30′.

The difference between 45334 and the given mantissa, 55359, is 25.

The difference between 45334 and the next following mantissa, 45377, is 43, and $^{2.5}_{4.5}$ of $60^{\prime\prime}=35^{\prime\prime}$.

As the function is increasing, the $35^{\prime\prime}$ must be added to $16^{\circ}\,30^{\prime}$; and the required angle is $16^{\circ}\,30^{\prime}\,35^{\prime\prime}$.

Find the angle for which $\log \cot = 0.73478$.

Page 32. The mantissa of the nearest smaller log cot in the table is 73415.

The angle corresponding to this value is $10^{\circ} 27'$.

The difference between 73415 and the given mantissa is 63.

The difference between 73415 and the next following mantissa is 71, and $\frac{63}{71}$ of 60'' = 53''.

As the function is decreasing, the 53" must be subtracted from 10° 27'; and the required angle is 10° 26′ 7".

EXERCISES.

Find

1.	log sin 30° 8′ 9″.	9.	log tan 25° 27′ 47″.
2.	log sin 54° 54′ 40″.	10.	log cos 56° 11′ 57″.
3.	log cos 43° 32′ 31″.	11.	log cot 62° 0′ 4″.
4.	log cos 69° 25′ 11″.	12.	$\log \cos 75^{\circ} 26' 58''$.
5.	log tan 32° 9′ 17″.	13.	log tan 33° 27′ 13″.
6.	$\log \tan 50^{\circ} 2' 2''$.	14.	log cot 81° 55′ 24″.
7.	log cot 44° 33′ 17″.	15.	log tan 89° 46′ 35″.
8.	log cot 55° 9′ 32″.	16.	$\log \tan 1^{\circ} 25' 56''$.

Find the angle A if

```
17. \log \sin A = 9.70075.
                                   25. \log \cos A = 9.40008.
18. \log \sin A = 9.91289.
                                   26. \log \cot A = 9.78815.
19. \log \cos A = 9.86026.
                                   27. \log \cos A = 9.34301.
20. \log \cos A = 9.54595.
                                   28. \log \tan A = 10.52288.
                                   29. \log \cot A = 965349.
21. \log \tan A = 9.79840.
22. \log \tan A = 10.07671.
                                   30. \log \sin A = 8.39316.
23. \log \cot A = 10.00675.
                                   31. \log \sin A = 8.06678.
                                   32. \log \tan A = 8.11148.
24. \log \cot A = 9.84266.
```

27. If log sec or log esc of an angle is desired, it may be found from the table by the formulas,

$$\sec A = \frac{1}{\cos A}$$
; hence, $\log \sec A = \operatorname{colog} \cos A$.
 $\csc A = \frac{1}{\sin A}$; hence, $\log \csc A = \operatorname{colog} \sin A$.

Page 31. $\log \sec 8^{\circ} 28' = \operatorname{colog} \cos 8^{\circ} 28' = 0.00476$. Page 42. $\log \csc 59^{\circ} 36' 44'' = \operatorname{colog} \sin 59^{\circ} 36' 44'' = 0.06418$.

28. If a given angle is between 0° and 1°, or between 89° and 90°; or, conversely, if a given log sin or log cos does *not* lie between the limits 8.24186 and 9.99993 in the table; or, if a given log tan or log cot does *not* lie between the limits 8.24192 and 11.75808 in the table; then pages 21–24 of Table III. must be used.

On page 21, log sin of angles between 0° and 0° 3', or log cos of the complementary angles between 89° 57' and 90° , are given to every second; for the angles between 0° and 0° 3', log tan = log sin, and log cos = 0.00000; for the angles between 89° 57' and 90° , log cot = log cos, and log sin = 0.00000.

On pages 22–24, log sin, log tan, and log cos of angles between 0° and 1°, or log cos, log cot, and log sin of the complementary angles between 89° and 90°, are given to every 10″.

Whenever log tan or log cot is not given, they may be found by the formulas,

$$\log \tan = \operatorname{colog} \cot$$
. $\log \cot = \operatorname{colog} \tan$.

Conversely, if a given log tan or log cot is not contained in the table, then the colog must be found; this will be the log cot or log tan, as the case may be, and will be contained in the table.

On pages 25–27 the logarithms of the functions of angles between 1° and 2°, or between 88° and 90°, are given in the manner employed on pages 22–24. These pages should be used if the angle lies between these limits, and if not only degrees and minutes, but degrees, minutes, and multiples of 10" are given or required.

When the angle is between 0° and 2°, or 88° and 90°, and a greater degree of accuracy is desired than that given by the table, interpolation may be employed; but for these angles interpolation does not always give true results, and it is better to use Table IV.

Find log tan 0° 2' 47", and log cos 89° 37' 20".

Page 21. $\log \tan 0^{\circ} 2' 47'' = \log \sin 0^{\circ} 2' 47'' = 6.90829 - 10.$ Page 23. $\log \cos 89^{\circ} 37' 20'' = 7.81911 - 10.$

Find log cot 0° 2′ 15″.

Page 21. $\log \tan 0^{\circ} 2' 15'' = \frac{6.81591 - 10}{3.18409}$ Therefore, $\log \cot 0^{\circ} 2' 15'' = \frac{3.18409}{3.18409}$

Find log tan 89° 38′ 30″.

Page 23. log cot 89° 38′ 30″ = $\frac{7.79617 - 10}{2.20383}$ Therefore, log tan 89° 38′ 30″ = $\frac{2.20383}{2.20383}$

Find the angle for which $\log \tan = 6.92090 - 10$.

Page 21. The nearest log tan is 6.92110 - 10. The corresponding angle for which is 0° 2′ 52″.

Find the angle for which $\log \cos = 7.70240 - 10$.

Page 22. The nearest log cos is 7.70261 - 10. The corresponding angle for which is 89° 42′ 40″.

Find the angle for which $\log \cot = 2.37368$.

This log cot is not contained in the table.

The colog cot = $7.62632 - 10 = \log \tan x$.

The log tan in the table nearest to this is (page 22) 7.62510 - 10, and the angle corresponding to this value of log tan is 0° 14′ 30″.

29. If an angle x is between 90° and 360°, it follows, from formulas established in Trigonometry, that,

between 90° and 180°, between 180° and 270°, log $\sin x = \log \sin (180^{\circ} - x)$, $\log \cos x = \log \cos (180^{\circ} - x)_n$, $\log \tan x = \log \tan (180^{\circ} - x)_n$, $\log \cot x = \log \cot (180^{\circ} - x)_n$; log $\cot x = \log \cot (180^{\circ} - x)_n$; between 180° and 270°, $\log \sin x = \log \sin (x - 180^{\circ})_n$, $\log \cot x = \log \cot (x - 180^{\circ})_n$; log $\cot x = \log \cot (x - 180^{\circ})_n$;

between 270° and 360°,

log sin $x = \log \sin (360^{\circ} - x)_{n}$, log cos $x = \log \cos (360^{\circ} - x)$, log tan $x = \log \tan (360^{\circ} - x)_{n}$, log cot $x = \log \cot (360^{\circ} - x)_{n}$. The letter n is placed (according to custom) after the logarithms of those functions which are negative in value.

The above formulas show, without further explanation, how to find by means of Table III. the logarithms of the functions of any angle between 90° and 360°.

```
Thus, \log \sin 137^{\circ} 45' 22'' = \log \sin 42^{\circ} 14' 38'' = 9.82756 - 10. \log \cos 137^{\circ} 45' 22'' = \log_n \cos 42^{\circ} 14' 38'' = 9.86940_n - 10. \log \tan 137^{\circ} 45' 22'' = \log_n \tan 42^{\circ} 14' 38'' = 9.95815_n - 10. \log \cot 137^{\circ} 45' 22'' = \log_n \cot 42^{\circ} 14' 38'' = 0.04185_n. \log \sin 209^{\circ} 32' 50'' = \log_n \sin 29^{\circ} 32' 50'' = 9.69297_n - 10. \log \cos 330^{\circ} 27' 10'' = \log \cos 29^{\circ} 32' 50'' = 9.93949 - 10.
```

Conversely, to a given logarithm of a trigonometric function there correspond between 0° and 360° four angles, one angle in each quadrant, and so related that if x denote the acute angle, the other three angles are $180^{\circ} - x$, $180^{\circ} + x$, and $360^{\circ} - x$.

If besides the given logarithm it is known whether the function is positive or negative, the ambiguity is confined to *two* quadrants, therefore to *two* angles.

Thus, if the log tan = 9.47451-10, the angles are $16^{\circ}36'17''$ in Quadrant II. and $196^{\circ}36'17''$ in Quadrant III.; but if the log tan = 9.47451_n-10 , the angles are $163^{\circ}23'43''$ in Quadrant II. and $343^{\circ}23'43''$ in Quadrant IV.

To remove all ambiguity, further conditions are required, or a knowledge of the special circumstances connected with the problem in question.

TABLE IV.

30. This table (page 50) must be used when great accuracy is desired in working with angles between 0° and 2° , or between 88° and 90° .

The values of S and T are such that when the angle a is expressed in seconds,

```
S = \log \sin a - \log a'',

T = \log \tan a - \log a''.
```

Hence follow the formulas given on page 50.

The values of S and T are printed with the characteristic 10 too large, and in using them -10 must always be annexed.

```
Find log sin 0^{\circ} 58' 17".

0^{\circ} 58' 17" = 3497"
\log 3497 = 3.54370
S = 4.68555 - 10
\log \sin 0^{\circ} 58' 17" = 8.22925 - 10

Find log cos 88° 26' 41.2" = 1^{\circ} 33' 18.8"
= 5598.8^{\circ}
\log 5598.8 = 3.74809
S = 4.68552 - 10
\log \cos 88^{\circ} 26' 41.2" = 8.43361 - 10
```

```
Find log tan 0° 52′ 47.5″. Find log tan 89° 54′ 37.362″. 0° 52′ 47.5″ = 3167.5″ \\ log 3167.5 = 3.50072 \\ T = \underbrace{4.68561 - 10}_{0 \text{ tan } 0° 52′ 47.5″} = 8.18633 - 10} Find log tan 89° 54′ 37.362″ = 0° 5′ 22.638″  = 322.638″ \\ log 322.638 = 2.50871 \\ T = \underbrace{4.68558 - 10}_{0 \text{ tog tan } 89° 54′ 37.362″} = 7.19429 - 10 \\ log tan 89° 54′ 37.362″ = 2.80571
```

Find the angle, if $\log \sin = 6.72306 - 10$.

$$\begin{array}{c} 6.72306-10 \\ \mathrm{S} = \underbrace{\frac{4.68557-10}{2.03749}}_{\mathrm{Subtract}} = \log 109.015 \\ 109.015'' = 0^{\circ} 1' 49.015''. \end{array}$$

Find the angle for which $\log \cot = 1.67604$.

$$\begin{array}{c} {\rm colog\;cot} = 8.32396 - 10 \\ {\rm T} = \underbrace{4.68564 - 10}_{3.63832} = \log 4348.3 \\ {\rm 4348.3''} = 1^{\circ} \, 12' \, 28.3''. \end{array}$$

Find the angle for which $\log \tan = 1.55407$.

colog tan =
$$8.44593 - 10$$

 $T = 4.68569 - 10$
Subtract, $3.76024 = \log 5757.6$
 $5757.6'' = 1^{\circ} 35' 57.6'',$
and $90^{\circ} - 1^{\circ} 35' 57.6'' = 88^{\circ} 24' 2.4''.$
Therefore, the angle required is $88^{\circ} 24' 2.4''.$

TABLE V.

31. This table (p. 51), containing the circumferences and areas of circles, does not require explanation.

TABLE VI.

32. Table VI. (pp. 52-69) contains the natural sines, cosines, tangents, and cotangents of angles from 0° to 90°, at intervals of 1'. If greater accuracy is desired it may be obtained by interpolation.

Note. In preparing the preceding explanations, we have made free use of the Logarithmic Tables by F. G. Gauss. For Table VI. we are indebted to D. Carhart.

TABLE VII.

33. This table (pp. 70–75) gives the latitude and departure to three places of decimals for distances from 1 to 10, corresponding to bearings from 0° to 90° at intervals of 15'.

If the bearing does not exceed 45° it is found in the *left*-hand column, and the designations of the columns under "Distance" are taken from the *top* of the page; but if the bearing exceeds 45°, it is found in the *right*-hand column, and the designations of the columns under "Distance" are taken from the *bottom* of the page.

The method of using the table will be made plain by the following examples:—

(1) Let it be required to find the latitude and departure of the course N. 35° 15′ E. 6 chains.

On p. 75, left-hand column, look for 35° 15'; opposite this bearing, in the vertical column headed "Distance 6," are found 4.900 and 3.463 under the headings "Latitude" and "Departure" respectively. Hence, latitude or northing = 4.900 chains, and departure or easting = 3.463 chains.

(2) Let it be required to find the latitude and departure of the course S. 87° W. 2 chains.

As the bearing exceeds 45° , we look in the right-hand column of p. 70, and opposite 87° in the column marked "Distance 2" we find (taking the designations of the columns from the bottom of the page) latitude = 0.105 chains, and departure = 1.997 chains. Hence, latitude or southing = 0.105 chains, and departure or westing = 1.997 chains.

(3) Let it be required to find the latitude and departure of the course N. 15° 45' W. 27.36 chains.

In this case we find the required numbers for each figure of the distance separately, arranging the work as in the following table. In practice, only the last columns under "Latitude" and "Departure" are written.

DISTANCE,	LATITUDE.	DEPARTURE.
$\begin{array}{ccc} 20 & = 2 \times 10 \\ & 7 & \end{array}$	$1.925 \times 10 = 19.25$ 6.737	$0.543 \times 10 = 5.43$ 1.90
$0.3 = 3 \div 10 \\ 0.06 = 6 \div 100$	$2.887 \div 10 = 0.289$ $5.775 \div 100 = 0.058$	$0.814 \div 10 = 0.081$ $1.628 \div 100 = 0.016$
27.36	26.334	7.427

Hence, latitude = 26.334 chains, and departure = 7.427 chains.

1		$\dots = 0.00000485\dots$	4. 68 557 487 — 10						

TABLE III.

THE LOGARITHMS

OF THE

TRIGONOMETRIC FUNCTIONS:

From 0° to 0° 3′, or 89° 57′ to 90°, for every second; From 0° to 2°, or 88° to 90°, for every ten seconds; From 1° to 89°, for every minute.

Note. To all the logarithms -10 is to be appended.

TABLE IV.

FOR DETERMINING WITH GREATER ACCURACY THAN CAN BE DONE BY MEANS OF TABLE III.:

- 1. log sin, log tan, and log cot, when the angle is between 0° and 2°;
- 2. log cos, log tan, and log cot, when the angle is between 88° and 90°;
- 3. The value of the angle when the logarithm of the function does *not* lie between the limits 8. 54 684 and 11. 45 316.

FORMULAS FOR THE USE OF THE NUMBERS S AND T.

I. When the angle α is between 0° and 2°:

II. When the angle α is between 88° and 90°:
